
EXAMPLE CHROMATOGRAMS

P1 MRTPA ZRH_2016_403_404_LC-HRAM-MS

Program Name	P1
Project Name	THS 2.2 Commercial Product Characterization
Covered Time Period	October 2016 – January 2017
Category of Experimental Work	Non-Targeted Differential Screening (NTDS) using LC-HRAM-MS
Document Author	Daniel Arndt
Document Owner	Mark Bentley

INTRODUCTION

This document describes the experimental example chromatograms for the comparison of the chemical aerosol composition of THS 2.2 high menthol (Dorado I ‘Vinny High Menthol’) HeatSticks using commercial THD 2.4 devices versus the conventional reference cigarette 3R4F acquired and reported during the study P1 MRTPA ZRH_2016_403_404_LC-HRAM-MS.

Aerosols for all test items were generated using the Health Canada intense smoking regimen and were analyzed by NTDS using LC-HRAM-MS with 4 independent analytical methods (RP HESI positive, RP HESI negative, RP APCI positive and HILIC HESI positive) as described in [1] PMI_RD_WKI_001225¹.

The example chromatograms are showing a representative subset of the study raw data. A representative chromatogram of each injected sample type (3R4F, THSH, Blank and SST) is shown for each applied method. The base peak chromatograms are normalized to a fixed scale of abundance per applied method for an enhanced visual comparability.

Blank samples representing aerosol generation blanks including a set of internal standards.
