Amendment Summary to the Final Report

**2-Year Chronic Toxicity/Carcinogenicity Feeding Study of Tobacco Blend and Aqueous Tobacco Extract in Wistar Han Rats: 2-Year Chronic Carcinogenicity Study**

Battelle Study Number CN49730G

**Parts Changed/Revised from the report signed on March 15, 2012:**

1. Page 44. The third sentence of the first paragraph has been changed from:

"In the current study, the average incidence rate ranged from 2 to 3 percent (1 to 2 out of 60 per group) for malignant basal cell skin carcinomas in females; ranged from 2 to 7 percent (1 to 4 out of 60 per group) for follicular cell adenomas in the thyroid gland of males; and ranged from 3 to 23 percent for benign adenomas in the mammary gland of TB females (2 to 14 out of 60 per group)."

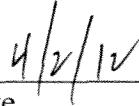

to:

"In the current study, the average incidence rate for groups involved in statistically significantly *decreasing* trends ranged from 7 to 0 percent for malignant basal cell skin carcinomas in CF (4 of 60) and TE (0 of 60 at the highest dose) females; ranged from 12 to 0 percent for benign follicular cell adenomas in the thyroid gland of CM (7 of 58), CBM (7 of 59), and TE (0 of 60 at the highest dose) males; and ranged from 23 to 3 percent for benign adenomas in the mammary gland of CF (8 of 60), CBF (14 of 60), and TB (2 of 60 at the highest dose) females."

Reason for these changes: These changes were made to correct values and to provide further clarification.

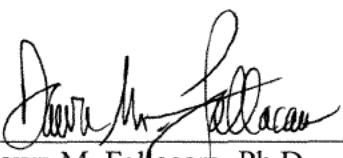

2. Appropriate changes were made to the title page, the Signature page, the Good Laboratory Practice Compliance Statement, and the Quality Assurance Statement. Due to the size of the original report, title page and pages 2, 3, 9, 10, and 44 were replaced and indicated by "*amended page*" at the top of each amended page in the amended final report.

**GOOD LABORATORY PRACTICE COMPLIANCE STATEMENT**

This study was conducted in compliance with the Food and Drug Administration's (FDA) Good Laboratory Practice (GLP) regulations (21 CFR Part 58), for the conduct of non-clinical laboratory studies with the following exceptions: characterization and stability analysis of bulk test articles (Appendix B), the Smokeless Tobacco and Extract Rodent Toxicology Feeding Studies: Test Article Stability with Time Report (Appendix C), and serology analyses (Appendix L) were conducted, as intended, under non-GLP development procedures.

## SUMMARY

The objective of this study was to compare the carcinogenicity of a tobacco blend (TB) and an aqueous tobacco extract (TE) of the tobacco blend, and appropriate controls (diet negative control); and to evaluate comparable doses of tobacco blend with aqueous tobacco extract in Wistar Han rats. The two test articles were dosed separately in the feed and were compared to feed containing no test article. The following evaluations were performed: clinical observations, body weights, food consumption, ophthalmic exams, toxicokinetics, gross necropsy, and microscopic exams. Because tobacco is a chemically complex botanical product, nicotine was used as a tracking compound to monitor the administered TB and TE doses. The overall summary of the estimated target nicotine doses of the tobacco blend and aqueous tobacco extract test articles are listed below, along with the dose group abbreviations used throughout the report ([Table 1](#)):

b. Abbreviations used throughout the report to designate the dosage groups of male and female rats.

-- = Not applicable.

There were no treatment-related effects related to mortality or clinical signs of toxicity apparent over the course of this 2-year chronic carcinogenicity study, as the survival of each of the TB and TE treatment groups was similar to that of their respective control groups, and treated animals were similar to control in overt behavior and in general health and appearance. The only treatment-related effect during the course of the study was a reduction in body

weight, which was dose-related and most pronounced in the female treatment groups. Although dose-dependent reductions in body weight were apparent for both male and female rats, body weights were generally similar between TB and TE groups at comparable doses. Daily food consumption over the course of the study was not significantly decreased among male treatment groups compared to their respective control; however, food consumption of B5F and E5F females was significantly reduced compared to CF females. Reduction in food consumption likely contributed to the reduced weight gain in the female high dose treatment groups. No treatment-related ophthalmic abnormalities were detected at approximately 12-months of dosing or at study termination. There were no overt formulation effects during this chronic study. The TB and TE formulations at a given exposure level showed similar  $C_{max}$  values between males and females; the  $C_{max}$  values increased dose-proportionally with an increase in the target nicotine exposure for both the TB and TE treatment groups; and there was no consistent change (increase or decrease) in group mean nicotine or cotinine  $C_{max}$  values over time. There were no microscopic findings that were considered to be treatment-related. Although some nonneoplastic and neoplastic changes were observed, these findings were typical of spontaneous background changes that occur in untreated Wistar Han rats, and were interpreted to be neither toxicologically nor biologically significant. None of the microscopic findings in this study were interpreted to be due to exposure to TB or TE test article administration, and the effects of the TB and TE test articles were generally similar between comparable doses.

## **1.0 INTRODUCTION**

The objective of this study was to evaluate the toxicity and carcinogenicity of a tobacco blend and aqueous extract of that tobacco blend in comparison with a diet negative control, and to evaluate comparable doses of tobacco blend with aqueous extract of that tobacco blend in Wistar Han rats. The study also included the determination of plasma concentrations of nicotine and cotinine under various conditions of test article exposure.

R.J. Reynolds Tobacco Company was the Sponsor of the study. Dr. Suzana Theophilus was designated as the Sponsor Monitor and approved the study protocol.

This study was conducted at Battelle under the direction of Dr. Milton Hejtmancik from study initiation through April 19, 2010. The remainder of the study was conducted under the direction of Dr. Dawn M. Fallacara. The in-life portion of the study began with exposure initiation on March 3, 2009 and ended with final necropsy on March 18, 2011. The 12-month chronic toxicity study has been reported previously (Fallacara, 2011).

## 2.0 EXPERIMENTAL DESIGN

Nine hundred sixty male and female Wistar Han rats (480 per sex) were randomized into eight dose groups, and 30 rats of each sex were used as sentinels. The general study design is presented in [Table 2](#). Group 2 (Control-B) was included in the experimental design as an independent control group that duplicated Group 1 (Control-A) for the carcinogenicity evaluation. This control group was available for microscopic evaluation of additional animals not exposed to the test articles in order to ensure that enough animals survive by the end of the study and to allow for a clear understanding of background/spontaneous tumors.

a. Nicotine/cotinine analysis.

b. Five extra rats have been included in each dose group for potential replacement of any animal that may die or be unsuitable for blood sample.

c. Control-B is an independent control group that duplicates Control-A for the carcinogenicity phase of the study.

Treated rats were exposed to the test articles (tobacco blend and aqueous tobacco extract) in dosed feed, and were compared to the appropriate controls that received diets containing no test article. Exposure of the animals to the test articles was by *ad libitum* consumption of NTP-2000 powdered feed. Chemical analysis using nicotine as the tracking compound was performed for each diet formulation batch at each dose. Homogeneity and stability studies were also conducted to ensure the test article concentrations were accurate and were distributed homogenously in the feed. The 2-year carcinogenicity study included the following: clinical observations, body weights, body weight changes, food consumption, ophthalmic exams, toxicokinetics, gross necropsy, and microscopic exams.

### 3.0 METHODS

#### 3.1 Protocol, Amendments, and Deviations

The study protocol, amendments to the protocol, and deviations from the protocol are provided in [Appendix A](#). There were no deviations that occurred during the conduct of the study that were considered to significantly affect the quality or integrity of the study.

From March 2 through March 29, 2009, within each dose group, male rats were fed the concentration of the test article in feed that was intended for females, and vice versa, from the first formulation. This incident had no impact on the study, as the body weights and dose concentrations were similar between sexes and corresponding dose groups. The Deviation Report including estimated exposure concentrations based upon actual group mean food consumption and body weight data is presented in [Appendix A](#).

#### 3.2 Test Articles (Tobacco Blend, Aqueous Tobacco Extract)

Test articles, a tobacco blend containing no additives and an aqueous tobacco extract of the tobacco blend, were supplied by R.J. Reynolds Tobacco Company and were received on May 7, 2008. A total of approximately 1278 lbs of tobacco blend (Lot No. OT162AF, Expiration Date March 2012) was received in 71 containers (18 lbs per bucket) and a total of approximately 1105.5 lbs of tobacco extract (Lot No. OT162AE, Expiration Date March 2012) was received in 33 containers (33.5 lbs per bucket). Test articles were provided by the Sponsor in plastic buckets and were stored frozen (-30 to -15°C). The Certificates of Analysis and the Test Article Characterization and Stability Report for test articles are provided in [Appendix B](#). The identity, strength, purity, composition, stability, and methods of synthesis of test articles were the responsibility of the Sponsor.

Reserve samples of each set of the tobacco blend and aqueous tobacco extract test articles used to formulate the animal diets were collected under design form CN49730A-TASTAB ([Appendix C](#)). Reserve samples of the tobacco blend and tobacco extract were maintained frozen (-30 to -15°C) until submission of the 2-year carcinogenicity study final report.

### 3.3 Formulation Preparation and Analysis

#### 3.3.1 Formulation Preparation

Diet formulations were prepared at monthly intervals for the first 3 months and bi-monthly thereafter according to a procedure developed by Battelle for this study, based on methods provided by the Sponsor. The concentration of test article in the feed was based on the anticipated food consumption and body weight changes of Wistar Han rats to maintain a constant dose throughout the study. Dosing concentrations were derived based on the information provided in [Tables 3 through 5](#). Exposure of the animals to the test articles was by *ad libitum* consumption of the NTP-2000 powdered feed. Formulations were stored at room temperature prior to use and were discarded on or after their expiration date. Stability of formulations was evaluated under design form CN49730A-FORMPRE ([Appendix D](#)).

### **3.3.2 Preparation of the Tobacco Blend Formulations**

A sufficient amount of tobacco blend to prepare all tobacco blend formulations was ground through a Thomas Wiley Laboratory Mill with a 0.5 mm screen. In small increments, the ground tobacco blend was sieved with a 20 (No. 20) mesh screen. The tobacco blend that did not go through the sieve was discarded. Blank NTP-2000 feed and the sieved tobacco blend (the amounts differ based on the formulation concentration, but the combined target weights equal 4000 g) were weighed into separate containers for preparation of a premix. The tobacco blend and an approximate equal portion of blank feed were added to a 20 quart mixing bowl. The contents were mixed with a Hobart mixer at a slow speed. The blank premix feed was added in equal portions and mixed thoroughly until all the premix feed had been incorporated with the tobacco blend.

Blank NTP-2000 feed (amounts varied based on the size of the batch) was weighed. Approximately half of the blank feed was transferred to an appropriately sized Patterson Kelly twin shell blender. The premix was transferred to the twin shell blender and distributed nearly level across the blank feed. The premix weighing container was “rinsed” twice with blank feed. The remaining blank feed was transferred to the twin shell blender and the blender was run for approximately 15 minutes. The formulations were then sampled and dispensed into the appropriate containers.

### **3.3.3 Preparation of the Tobacco Extract Formulations**

Blank NTP-2000 feed ( $11,500 \pm 10$  g for premix) and the tobacco extract (the amounts differ based on the formulation concentration) were weighed into separate containers for preparation of a premix. The tobacco extract was diluted to  $500 \pm 5$  g with deionized water (if it was transferred from a small to a larger container, the container was rinsed with deionized water before the dilution to 500 g). The contents in the container were mixed well to create an homogenous solution. Approximately half of the premix feed was added to a Hobart Processor. The tobacco extract diluted with deionized water was poured directly onto the feed and the container of the solution was rinsed three times with blank feed, which was added to the Hobart Processor. The processor mixed for approximately 5 minutes with the scraping blade being turned at least five times throughout the 5 minute period. Using a large spatula,

the premix was stirred thoroughly to make sure no large clumps were created. If large clumps were created, the processor was continually turned on until the clumps were dispersed. Half of the remaining blank premix feed was added to the processor and mixed for approximately 5 minutes with the scraping blade being turned at least five times throughout the 5 minute period. Using a large spatula, the premix was stirred thoroughly to make sure no large clumps were created. If large clumps were created, the processor was continually turned on until the clumps were dispersed. The remaining blank feed for the premix was added to the processor and mixed for approximately 5 minutes, and the previously described mixing steps were repeated.

Blank NTP-2000 feed (amounts varied based on the size of the batch) was weighed. Approximately half of the blank feed was transferred to an appropriately sized Patterson Kelly twin shell blender. The premix was transferred to the twin shell blender and distributed nearly level across the blank feed. The premix weighing container was “rinsed” twice with blank feed. The remaining blank feed was transferred to the twin shell blender and the blender was run for approximately 15 minutes. The formulations were then sampled and dispensed into the appropriate containers.

### **3.3.4 Chemical Analysis of Formulations**

One formulation analysis sample and one formulation retention sample were taken from the formulation batches prepared for each diet at each dose and were stored at room temperature. Nicotine was used as the tracking compound for the formulation analysis. Animal room samples were collected on the last day of use of the first formulation preparation. Homogeneity was evaluated during the first and fourth dose formulations.

## **3.4 Experimental Animals**

A total of 960 male and female Wistar Han rats (480 per sex) were required for the carcinogenicity study. A total of 140 males and females (70 per sex) were required for toxicokinetics. An additional 30 rats per sex were required for use as sentinels for disease monitoring. A sufficient number of animals were obtained from Charles River Laboratories (Raleigh, NC) to provide the required number of healthy animals for testing. The rats were

approximately 5 weeks of age at animal receipt and ranged in body weight from approximately 105 to 211 grams at Day 1 of the study.

The rat was chosen as the test system because considerable scientific documentation exists pertaining to the rat as a predictive animal model for humans. Currently there are no *in vitro* or computer models that can replace the integrative function of the whole animal model. The Battelle Institutional Animal Care and Use Committee approved the proposed activities before implementation of this study.

Rats were housed in rooms 7C-074 ([Figure 1](#)), 7C-078 ([Figure 2](#)), and 7C-076 ([Figure 3](#)), from study initiation until March 31, 2010. On that date, rats were transported to adjoining rooms 7-2-007 and 7-2-009 ([Figure 4](#)), and adjoining rooms 7-2-040 and 7-2-042 ([Figure 5](#)) for the remainder of the study. Room, rack, and cage assignments, as well as the direction of rack and cage rotation, are presented in [Figures 1](#) through [5](#). Cages were changed at least twice weekly or as often as necessary to keep the rodents clean and dry. Racks were changed, and racks and cages were rotated, every 2 weeks in accordance with facility SOP.

### **3.4.1 Animal Housing and Environmental Conditions**

All animals were received, quarantined, and housed in polycarbonate cages with hardwood bedding according to testing facility standard operating procedures (SOPs). Male rats assigned to study were housed up to two per cage and female rats assigned to study were housed up to three per cage. All housing and animal care and maintenance conformed to the Association for Assessment and Accreditation of Laboratory Animal Care (AAALAC) recommendations, current requirements stated in the Guide for the Care and Use of Laboratory Animals (National Research Council, 1996).

The environmental conditions of the animal study rooms conformed to the following: (1) the light/dark cycle was set to maintain approximately 12 hours of light and 12 hours of dark each day during the study using fluorescent lighting, starting at approximately 6:00 AM each day; (2) the room temperature and relative humidity controls were set to maintain 64 to 79°F and 30 to 70 percent, respectively, and were monitored for conformance; and (3) fresh air was supplied to the room at a rate providing a minimum of ten changes of room air per hour.

### 3.4.2 Diet

Animals were fed powdered NTP-2000 (Harlan Teklad, Madison, WI) rodent diet *ad libitum* according to facility SOP except when fasted prior to the scheduled necropsy. The control group was fed the diet without test article and treated animals were fed the diet with the specified quantity of test article required to maintain their designated doses. Analysis reports of each feed lot were supplied by the vendor and were maintained by Battelle. There were no known or reported contaminants in the feed that would have any impact on study results or interpretations.

### 3.4.3 Water

Fresh water from the city of Columbus municipal water supply was provided *ad libitum* via automatic watering system. The water supply was monitored under Battelle SOPs. Water samples were collected within 6 months from the start of the study on December 9, 2008 for chemical and microbial analysis. Results were available on January 7, 2009 and November 4, 2010, and indicated there were no known or reported contaminants in the water that would have any impact on study results or interpretations.

## 3.5 Serology

The serology screen was conducted using five males and five females soon after arrival and was conducted according to facility SOP. These animals were necropsied to evaluate any signs of disease. Initiation of the study was dependent on negative serology and no evidence of disease in the animals. Serology was evaluated at approximately 1, 6, 9, and 14 months of the study, and again near termination of the study.

Rat serology endpoints were as follows:

Sendai virus	Mouse adenovirus (MAV) 1 & 2
Pneumonia virus of mice (PVM)	Hantaviruses (HANT)
Sialodacryoadenitis virus (SDAV)	<i>Encephalitozoon cuniculi</i> (ECUN)
Kilham rat virus (KRV)	Cilia associated respiratory bacillus (CARB)
H-1 virus (H-1)	Mouse parvovirus (MPV) or PARV NS1
GDVII (murine encephalomyelitis virus)	Rat parvovirus (RPV)
REO	Rat minute virus (RMV)
<i>Mycoplasma pulmonis</i>	
Lymphocytic choriomeningitis virus (LCMV)	

All serological samples were submitted to Research Animal Diagnostic Laboratory (RADIL), Columbia, MO, for analysis.

### **3.6 Treatment Group Allocation and Animal Identification**

Animals were identified by pre-study numbers on cage cards during quarantine and acclimation. Following group assignment, rats were individually identified by tail tattoo.

Prior to the initiation of exposures, animals were assigned to study groups using the PATH/TOX SYSTEM (Version 4.2.2, Xybion Medical Systems Corporation, Cedar Knolls, NJ). The PATH/TOX SYSTEM software algorithm ensures homogeneity of group variances with respect to body weight across all groups. The following were the group assignments and animal identification numbers:

<b>Animal Identification Numbers</b>				
<b>Group</b>	<b>Males</b>		<b>Females</b>	
	<b>Core</b>	<b>TK</b>	<b>Core</b>	<b>TK</b>
1 - Control-A	121-180	1001-1010	1121-1180	2001-2010

### **3.7 Experimental Design**

Rats were randomized into eight dosage groups and one sentinel group. The 24-month carcinogenicity study included the following endpoints to evaluate the potential chronic toxicity of tobacco blend and aqueous tobacco extract: clinical observations, body weights, body weight changes, food consumption, ophthalmic exams, toxicokinetics, gross necropsy, and microscopic exams.

### **3.8 Clinical Observations**

Cage-side observations for moribundity and mortality were made twice daily, once in the morning and once in the afternoon, with at least 6 hours between observations (no later than 10:00 AM and no earlier than 2:00 PM) throughout the duration of study. Clinical

examinations were conducted on all animals at weekly intervals. A final detailed clinical examination was conducted on each study rat on the day of scheduled necropsy.

### **3.9 Body Weights**

Individual body weights of animals were recorded on Day -6 (with respect to core males), Day -7 (with respect to core females), Day -11 (with respect to TK males), and Day -12 (with respect to TK females) for randomization and group assignment. After initiation of dosing, body weights (core and TK) were recorded weekly for the first 13 weeks of the study and every 4 weeks thereafter until study termination.

### **3.10 Food Consumption**

Food consumption was measured over an approximate 24 hour period starting on Study Day 1. Food consumption was measured weekly for the first 13 weeks of the study and every 4 weeks thereafter until study termination. A known amount of food was placed in the feed container and reweighed after 3 or 4 day intervals over a 1-week period. The difference in the weight of the food container was taken as a measurement of food consumed per cage. Food consumption (g/day) was calculated for each cage as the average quantity consumed per animal per day.

### **3.11 Toxicokinetics**

Ten rats per sex were included in each dose group, excluding the Control-B group and sentinel groups, for plasma nicotine and cotinine concentrations. The methodology for plasma nicotine and cotinine analysis was validated under design form CN49730A-BIOVAL.

Toxicokinetic plasma collection occurred on each Tuesday (males) and Wednesday (females) on Weeks 5, 14, and every 4 months thereafter (Weeks 31, 49, 66, 83, and 101). Samples were collected at a single time point (12:00 AM) for nicotine and cotinine analysis in five male and five female rats from up to seven dose groups at each of the time periods (35 total TK samples/sex/time period). Five extra rats were included in each dose group for potential replacement of any rat that died or was determined to be unsuitable for blood sampling. The data from each sampling period was used to evaluate dose proportionality and nicotine metabolism by sex and group.

Toxicokinetic study rats were anesthetized with CO<sub>2</sub>/O<sub>2</sub> and blood was collected from the retro-orbital sinus into tubes containing potassium EDTA as the anti-coagulant. A target volume of 500 µL of blood was collected at each time point according to facility SOP. Samples were placed on wet ice until centrifuged. Plasma was transferred into appropriately labeled tubes and placed on dry ice until stored in a freezer set to maintain -60 to -80°C.

After each blood collection, the animal was placed back in its home cage and supplied with feed and water until the next scheduled blood collection. These animals remained on study for subsequent plasma nicotine and cotinine analyses. Toxicokinetic animals were euthanized after the last TK plasma collection day with no further data collected.

Toxicokinetic parameters evaluated included the C<sub>max</sub> and T<sub>max</sub>. An audited toxicokinetic report and an audited bioanalytical report, together with appropriate QA documentation, were provided to the Study Director for inclusion into the final report.

### **3.12 Ophthalmic Examination**

Ophthalmic examinations were conducted on all potential core carcinogenicity animals according to facility SOP by a staff veterinarian prior to selection/group assignment.

Ophthalmic exams were also performed after 12 months and near the termination of the carcinogenicity phase for all core carcinogenicity study animals, excluding the Control-B group and sentinels. A mydriadic drug was used for ophthalmic exams.

### **3.13 Necropsy**

After at least 24 months of dosing, all surviving core carcinogenicity animals (excluding sentinels) were fasted overnight and humanely terminated using a combination of CO<sub>2</sub> inhalation and exsanguination. External features of the animals were evaluated prior to euthanasia, followed by necropsy.

Each necropsy included: examination of the external surface of the body; all orifices; the cranial, thoracic, abdominal and pelvic cavities and their contents; and collection of all tissues listed in the protocol, as well as gross findings. All scheduled necropsies were conducted under the supervision of a board-certified veterinary pathologist.

The following tissues were collected according to facility SOP. Tissues were fixed in 10 percent neutral buffered formalin (NBF), with the exception of testes, which were preserved in Bouin's fixative and subsequently transferred to 70 percent ethanol, and eyes with optic nerve were fixed in Davidson's fixative and subsequently transferred to 10 percent NBF, per facility SOP.

#### **3.14 Tissue Processing**

All fixed tissues from the controls (Groups 1 and 2) and all treatment groups (Groups 3 to 8) were processed to slides and stained with hematoxylin and eosin according to facility SOP for histopathologic examination.

#### **3.15 Histopathologic Evaluation**

Tissue slides from core rats in the controls (Groups 1 and 2) and all treatment groups (Groups 3 to 8) were examined microscopically by a board-certified veterinary pathologist. An internal peer review was performed according to facility SOP.

### 3.17 Data Analysis

All appropriate quantitative in-life data were analyzed statistically using the PATH/TOX SYSTEM, Version 4.2.2, when  $n \geq 3$ . All data were analyzed for test article effects by analysis of variance. Homogeneity was determined by Bartlett's test for homogeneity at the  $p \leq 0.05$  level of significance. Homogenous data were analyzed using Dunnett's t-test. Non-homogeneous data was analyzed using Cochran and Cox's Modified two-sample t-test. Statistical significance for each comparison was reported at the  $p \leq 0.05$  level of significance. Comparisons included Control-A vs. Test Articles, and corresponding Blend vs. Extract dose groups. Multiple statistical comparisons are indicated on the tables throughout this report. Capital letters indicate the comparison was significantly different between groups with Dunnett's test of significance, while lower case letters indicate comparisons were significantly different with the Modified t-test. Qualitative data summaries were provided for clinical observations.

Statistical analyses of survival and tumor incidence data were performed using the STATA System (Version 11) software. Survival probabilities were calculated for each group using the Kaplan-Meier method, and survival curves were plotted. Tests for differences in intercurrent mortality among the study groups were conducted using the log-rank test. If dose

effects were observed, pairwise comparisons between the control and each dose group were conducted using the same method.

To test for positive linear dose-response trends in tumor incidence, each tumor observed in each animal was classified as either incidental, fatal, or mortality independent. Non-lethal occult tumors that did not contribute directly or indirectly to the early (unscheduled) death of an animal were classified as incidental tumors; tumors assumed to have caused the early (unscheduled) death of the animal were classified as fatal, and tumors present at study termination (scheduled sacrifice), which, therefore, could not have been responsible for the animal's death and yet were also not assumed to be incidental, were classified as mortality independent. Tumors classified as mortality independent by the study pathologist were treated as incidental tumors in the statistical analysis. Both tumor classifications were not the cause of death of the animal, but each were associated with a day of death at which the tumor was observed, which was used as the temporal component (time interval) in the statistical model.

While some types of tumors were observed in only one context (incidental or fatal), others were observed in both contexts. The methods used for the analysis of incidental, fatal, and combined tumor data were consistent with those currently recommended by the FDA for tumor analysis (Lin, 2000; CDER, 2001). Tests for linear dose trends were conducted separately for the tobacco blend and the tobacco extract. Cochran Armitage trend tests, using the Mantel-Haentzel method to pool results over time intervals, were used to test for positive linear dose trends in prevalence rates of incidental tumors. Tarone's trend tests were used to test for positive linear dose trends in tumors observed in a fatal context. If a specified type of tumor was observed in both incidental and fatal contexts among the eight dose groups, then the Peto's method was used.

## 4.0 RESULTS

### 4.1 Chemical Analysis of Formulations

#### 4.1.1 Pre-Dosing

Samples of formulations from the dose preparation of tobacco blend and tobacco extract were analyzed at Battelle for verification of nicotine concentrations based on methods provided by the Sponsor. Homogeneity studies performed to support the 90-day studies are provided in [Appendix D](#) (Hejmancik, 2009b). In the current study, homogeneity was confirmed during the first and fourth dose formulations using the methods described in [Appendix D](#). Nicotine was used as the tracking compound to determine the concentrations of the tobacco blend and tobacco extract in the feed. Generally, the pre-dose formulations of tobacco blend and tobacco extract that were analyzed for nicotine concentration met the acceptance criteria (within 10 percent of the target concentrations, and had relative standard deviation's (RSD's) and/or average relative errors (RE) less than 10 percent). The results of these analyses and the results of those formulations that did not meet acceptance criteria are presented in [Appendix E](#).

Because the test article for the blend is derived from tobacco plant material, the tobacco blend formulations are considered to be complex mixtures with varying particle sizes. Particle size is a primary factor affecting feed blend homogeneity and the production of blends is generally more difficult at the lower dosage levels (Jameson and Walters, 1984). This phenomenon was apparent in the current study where the RE and/or RSD for the low dose blend formulations used on study were generally  $\geq 10$  percent, but did not exceed 17.5 and 16.6 percent, respectively. Increasing the sample size from 3 to 6 during analysis diminished but did not eliminate the variability in test article concentration for the low dose formulations.

#### 4.1.2 Post-Dosing

Post-dose (animal room) samples were also analyzed for nicotine concentration from the first set of batches from the study ([Appendix E](#)). In general, the post-dose animal room concentrations agreed with the pre-dose concentrations. The concentration of all submitted post-dose formulation samples met the acceptance criteria for pre-dose samples (%RE within 10 percent of target; RSD less than or equal to 10 percent), with the following exceptions. The concentration results for 5-BLEND-3 (B0.2M) and 5-EXTRACT-1 (E0.2F) analyzed on April 6, 2009 had average REs of 10.3 and 23.4 percent, respectively.

## 4.2 Serology

All serology results were negative. Based on the negative serology results for the endpoints measured, the animals were free of any known underlying infectious disease that would affect the interpretation of the study. The results of these analyses are presented in [Appendix L](#).

## 4.3 Survival

There were no treatment-related effects on survival during this 2-year carcinogenicity study. At study termination, the survival rates of treated males in all dosage groups ( $\geq 75$  percent) were similar to the survival of the CM and CBM groups ( $\geq 77$  percent). Similarly, survival of treated females in all dosage groups ( $\geq 70$  percent) were similar to the survival of the CF and CBF groups ( $\geq 68$  percent). Two animals in the CM group (175 and 176) were reported as missing on Day 547. Since these animals were still alive on Day 547, they were treated as censored observations in the statistical analysis of survival. Kaplan-Meier survival curves associated with time to death (days) for male and female rats are presented in [Figure 6](#) and [Figure 7](#), respectively. Statistical analysis of the survival data indicated there was no difference in intercurrent mortalities among the study groups for either males or females ([Appendix M](#)).

## 4.4 Clinical Observations

Group summaries of the clinical abnormalities reported for male and female rats are presented in [Table 7](#) and [Table 8](#), respectively. No treatment-related clinical signs of toxicity were apparent over the course of the study and treated animals were similar to control in overt behavior and in general health and appearance. Clinical abnormalities were generally considered to be minor in severity and were not attributed to the administration of the TB or TE test articles.

## 4.5 Body Weights

The respective group mean absolute body weights for male and female rats are presented in [Table 9](#) and [Table 10](#), and are also presented graphically in [Figure 8](#) and [Figure 9](#) for the TB, and in [Figure 10](#) and [Figure 11](#) for the TE test articles. A dose-dependent reduction in body weight was apparent for male and female rats throughout the duration of the study. Treatment with the test articles resulted in significant reductions ( $p \leq 0.05$ ) in the B2M, B5M, and E2M groups starting on Day 14, and was observed for males in the E5M group starting on Day 7.

Significant body weight reductions for the B2M, B5M, E2M, and E5M groups continued throughout the duration of the study, and ended on Day 707 with 12.7, 18.1, 12.5, and 20.3 percent reductions relative to control, respectively. Among females, treatment with the TB and TE test articles resulted in significant reductions in the B5F and E5F groups beginning on Day 7, and was observed for the B2F and E2F groups starting on Days 56 and 70, respectively. Sporadic reductions in absolute body weight were also observed for the B0.2F group beginning on Day 315, but the decrease did not exceed a 10 percent difference from control by study termination. Significant reductions ( $p \leq 0.05$ ) in body weight for females in the B2F, B5F, E2F, and E5F groups continued throughout the duration of the study, and ended on Day 707 with 16.5, 28.3, 15.3, and 26.1 percent reductions relative to control, respectively. Although a dose-dependent reduction in body weight was seen among dosage groups, body weights were generally similar between TB and TE groups at comparable doses.

The respective group mean percent body weight gains for male and female rats are presented in [Figure 12](#) and [Figure 13](#) for the TB groups and in [Figure 14](#) and [Figure 15](#) for the TE groups. Group mean absolute body weight gains are presented in [Figure 16](#) and [Figure 17](#) for the TB groups, and in [Figure 18](#) and [Figure 19](#) for the TE groups.

The group mean absolute body weights for male and female TK animals are presented in [Table 11](#) and [Table 12](#), respectively, and are also presented graphically in [Figure 20](#) and [Figure 21](#) for the TB, and in [Figure 22](#) and [Figure 23](#) for the TE test articles. The number of animals in the TK groups was lower than in the core groups; therefore, TK body weight data may be less conclusive than core body weight data. TK animals had blood drawn throughout the course of the study, thus, TK body weights were collected only as supportive information. Among TK males, sporadic body weight reductions were apparent in the B5M, B2M, and E5M groups, predominantly during the second year of the study. TK male absolute body weights were generally similar between TB and TE groups at comparable doses; however, the E2M group was significantly reduced ( $p \leq 0.05$ ) compared to the B2M group for the majority of the study period. Among TK females, a dose-dependent reduction in body weight was apparent for both TB and TE test articles. Significant reductions ( $p \leq 0.05$ ) in body weight for TK females in groups B2F, B5F, E2F, and E5F continued throughout the duration of the study.

TK female absolute body weights were generally similar between TB and TE groups at comparable doses.

The respective group mean percent body weight gains for male and female TK rats are presented in [Figure 24](#) and [Figure 25](#) for the TB group and in [Figure 26](#) and [Figure 27](#) for the TE groups. Group mean absolute body weight gains are presented in [Figure 28](#) and [Figure 29](#) for the TB groups, and in [Figure 30](#) and [Figure 31](#) for the TE groups.

#### **4.6 Food Consumption**

The group mean average food consumed per day for male and female rats is presented in [Table 13](#) and [Table 14](#), and is also presented graphically in [Figure 32](#) and [Figure 33](#) for the TB test article and in [Figure 34](#) and [Figure 35](#) for the TE test article. Daily food consumption was generally similar between TB, TE and control groups, except for B5F and E5F, which consistently consumed less food than CF throughout the course of the study. The grand mean average food consumed per day for male rats exposed to TB and TE test articles did not differ significantly from the control. Treatment-related reductions in food consumption were apparent among female rats. From Day 7 through Day 707, food consumption for the B5F and E5F groups was significantly reduced ( $p \leq 0.05$ ) 17.1 and 15.1 percent, respectively, relative to CF. Significant differences in food consumption were also apparent in the B5M and E5M groups for the first several months of dosing; however, these aberrations became more spurious over time and were not apparent after the first year of dosing. Food consumption was generally similar between TB and TE groups at comparable doses.

#### **4.7 Toxicokinetics**

The Bioanalytical Report is provided in [Appendix G](#) and the Toxicokinetic Report is provided in [Appendix H](#). The  $T_{max}$  (i.e., 12:00 AM) was experimentally determined from a previous 28-day toxicity study (Hejtmancik, 2009a). The  $C_{max}$  values in the present study were used to evaluate systemic exposure to nicotine and cotinine during Weeks 5, 14, 31, 49, 66, 83, and 101, as well as evaluate sex, varying formulations, exposure level, and exposure duration effects. There were no overt formulation effects as TE and TB formulations at a given exposure level had similar  $C_{max}$  values for both males and females. The  $C_{max}$  values increased proportionally with an increase in exposure level for both the TB and TE, with the exception

of B5F on Week 66 which had lower than expected mean C<sub>max</sub> values for nicotine and cotinine. Cotinine C<sub>max</sub> values were generally 7- to 18-fold greater than nicotine values for a given treatment group and exposure level for both male and female rats, and there was no consistent change (increase or decrease) in group mean nicotine or cotinine C<sub>max</sub> values over time. C<sub>max</sub> values were generally similar (less than a 2-fold difference) on all study weeks for a given dosage group and sex.

#### **4.8 Ophthalmic Examinations**

A report for ophthalmic exams that were conducted pretest, at approximately 12-months of dosing, and again near the end of the study, is included in [Appendix I](#). Corneal crystals were noted in all dosage groups and at all time periods. Only ten out of 351 males and six out of 333 females had ocular abnormalities other than corneal crystals near the end of the study. There was no evidence that the corneal crystals detected at the 12-month or study termination period were associated with exposure to the TB or TE test articles.

#### **4.9 Gross Lesions**

Macroscopic (gross) findings are presented in [Appendix J](#). Few macroscopic findings were observed in this study. To the fullest extent possible, macroscopic findings were correlated microscopically. When compared to the respective controls for male and female rats, macroscopic findings did not appear related to TB or TE administration.

#### **4.10 Histopathology**

Microscopic findings for individual animals are presented in [Appendix J](#). Incidence summaries of all microscopic observations for males and females are presented in [Table 15](#) and [Table 16](#), respectively, and the incidence summaries of nonneoplastic graded observations with average severity are presented in [Table 17](#) and [Table 18](#), respectively.

Nonneoplastic findings were assigned a severity grade where appropriate, or coded as “present” without a severity grade (e.g. ovary cyst). Severity was graded on a 1 to 4 scale, where 1 = minimal (the change barely exceeded normality), 2 = mild (change was clearly discernible and of questionable or minor pathologic significance), 3 = moderate (change was substantial and may account for an alteration in tissue structure and/or function), and 4 = marked (change was essentially maximal).

Incidence summaries of benign primary neoplasms for males and females are presented in [Table 19](#) and [Table 20](#); and incidence summaries of malignant and infiltrative neoplasms are presented in [Table 21](#) and [Table 22](#), respectively. Neoplasms were coded as benign (B), malignant (M), or infiltrative (F).

In order to conduct a statistical analysis of tumor incidence among the appropriate dose groups, each tumor observed microscopically was classified into either incidental, fatal, or mortality independent categories. Incidental tumors were defined as tumors that did not contribute to the unscheduled death of an animal; fatal tumors were defined as tumors assumed to have caused the unscheduled death of an animal; and mortality independent tumors were defined as tumors present at study termination (scheduled sacrifice), which therefore could not have been responsible for the animal's death, but can also not be assumed to be incidental.

[Table 6](#) summarizes the incidence of neoplastic and nonneoplastic findings in the uterus. A greater incidence of uterine carcinoma was observed in the B5F (12 percent, 7/59) and E5F (7 percent, 4/59) groups when compared to the incidence in the CF group (2 percent, 1/60) and there did not appear to be a dose-response relationship upon examination of all groups ([Table 6](#)). The incidence of uterine carcinoma in all groups was within an acceptable background level for Wistar Han rats (Deerberg *et al.*, 1981; Charles River Laboratories, 2011). Thus, uterine carcinomas were deemed spontaneous in occurrence and unrelated to the TB or TE administration.

Several additional nonneoplastic and neoplastic microscopic findings were observed in the TB and TE treatment groups. When compared to the control, all such findings were typical of spontaneous background changes observed in untreated Wistar Han rats (Son *et al.*, 2010; Mitsumori *et al.*, 2001; Charles River Laboratories, 2011), and were interpreted to be neither toxicologically nor biologically significant. None of the microscopic findings in this study were interpreted to be due to exposure to TB or TE test article administration.

#### 4.11 Pathology Conclusions

There were no treatment related gross or microscopic findings following exposure of Wistar Han male and female rats at a target dose up to 5 mg/kg/day of nicotine in TB and TE administered in dosed feed for approximately 24 months.

#### 4.12 Tumor Analysis

Statistical analysis of the tumor data is presented in [Appendix M](#). Of the 90 tumor types identified during the microscopic examination of male and female Wistar Han rats, only two exhibited increasing dose response trends in tumor incidence. They include malignant carcinomas of the uterus in TB females ( $p = 0.0117$ ) and malignant mesothelioma in the epididymis for TB males ( $p = 0.0045$ ). The following females had malignant uterine carcinomas (all groups): 1152, 1321, 1324, 1345, 1368, 1371, 1423, 1425, 1471, 1525, 1530, 1539, 1550, 1556, 1561, 1577, 1670, 1672, 1680, 1851, 1858, 1868, 1879, and the following

males had malignant mesotheliomas in the epididymis (all groups): 522, 556, 560, 748. There were no increasing dose response trends in either males or females in the TE treatment groups.

Decreasing dose response trends in tumor incidence rates were observed for benign mammary gland adenomas for TB females ( $p \leq 0.0164$ ), malignant basal cell carcinomas in skin for TE females ( $p = 0.0031$ ), and for benign follicular cell adenomas in the thyroid gland for TE males ( $p \leq 0.010$ ).

## 5.0 DISCUSSION

No treatment-related mortality occurred over the course of this 2-year chronic carcinogenicity study, as the survival of each of the TB and TE treatment groups was similar to that of their respective control groups. In the current study, survival rates were  $\geq$  75 and 68 percent for male and female rats, respectively. These values are comparable to survival rates reported for Wistar Han rats surviving to the terminal sacrifice on a 104-week study. When the total number of animals on study per sex is  $\geq$  100, historical background survival rates for Wistar Han rats are approximately 62 to 83 percent for males and 64 to 78 percent for females (Charles River Laboratories, 2011).

No treatment-related clinical signs of toxicity were apparent over the course of the study, and treated animals were similar to control in overt behavior and in general health and appearance. Clinical abnormalities were generally considered to be minor in severity and were not attributed to the administration of the TB or TE test articles.

The only treatment-related effect during the 2-year carcinogenicity study was a reduction in body weight, which was dose-proportional and most pronounced in the female treatment groups. At study termination, the B2M, B5M, E2M, and E5M groups showed significant reductions ( $p \leq 0.05$ ) in body weight of 12.7, 18.1, 12.5, and 20.3 percent relative to the CM group; and females in the B2F, B5F, E2F, and E5F groups showed 16.5, 28.3, 15.3, and 26.1 percent significant ( $p \leq 0.05$ ) reductions relative to the CF group, respectively. Although dose-dependent reductions in body weight were apparent for both male and female rats, body weights were generally similar between TB and TE groups at comparable doses. Daily food consumption over the course of the study was not significantly decreased among male dosage groups compared to the respective control (CM). The high dose female groups, however, showed statistically significant ( $p \leq 0.05$ ) decreases of 17.1 (B5F) and 15.1 percent (E5F) compared to CF females. Reduction in food consumption likely contributed to the reduced weight gain in the female high dose treatment groups.

No treatment-related ophthalmic abnormalities were detected at approximately 12-months of dosing or at study termination. Corneal crystals were noted in all dosage groups and at all time periods; however, there was no evidence that the corneal crystals were associated with exposure to the TB or TE test articles. Although an increasing dose response seemed apparent

for the TB females after 12 months of dosing, there was no dose response trend in males exposed to the TB test article, nor did the trend persist in TB females at study termination. The lack of persistence of this effect in TB females, in particular, suggests this was not a treatment-related effect.

Toxicokinetic studies (plasma nicotine and cotinine measurements) were performed in conjunction with this chronic/carcinogenicity study to demonstrate that systemic exposure to the tobacco blend and the aqueous extract of the tobacco blend (using nicotine as a tracking compound) has occurred appropriately, and to establish any relationships with sex, formulation concentrations, exposure level, and exposure duration. There were no overt formulation effects during this chronic study. The TB and TE formulations at a given exposure level showed similar  $C_{max}$  values between males and females, and the  $C_{max}$  values increased dose-proportionally with an increase in the target nicotine exposure for both the TB and TE treatment groups. There was no consistent change (increase or decrease) in group mean nicotine or cotinine  $C_{max}$  values over time. The consistency of  $C_{max}$  values over time for a given dosage group (less than a two-fold difference) indicates that dose formulation adjustments based upon the anticipated food consumption and body weight changes of Wistar Han male and female rats were applicable, and no induction of metabolism or accumulation of nicotine had occurred during the course of the study.

There were no microscopic findings that were considered to be treatment-related. Although some nonneoplastic and neoplastic changes were observed, including some statistically significant differences, these findings were typical of spontaneous background changes that occur in untreated Wistar Han rats, and were interpreted to be neither toxicologically nor biologically significant. The occurrence of uterine carcinomas was: 1/60 (1.7 percent; CF), 5/60 (8.3 percent; B0.2F), 3/60 (5.0 percent; B2F), 7/59 (11.9 percent; B5F), 3/60 (5.0 percent; E0.2F), 0/60 (0.0 percent; E2F), and 4/59 (6.8 percent; E5F). In the 12-month toxicity study (20 animals/group/sex), there were no uterine carcinomas present at study termination (Fallacara *et al.*, 2010).

Uterine adenocarcinomas are known to occur spontaneously in Wistar Han rats but are considered to be rare tumors in F344 rats and Sprague Dawley rats (Mitsumori *et al.*, 2001; Son *et al.*, 2010). A longevity study in Wistar Han rats revealed that 16 out of 54 (30 percent)

rats examined at 2 years of age developed spontaneous metastatic uterine adenocarcinomas (Deerberg *et al.*, 1981). The age-related increase in the incidence of uterine carcinomas in the Deerberg *et al.* study was apparent by 13 to 18 months of age and increased substantially by 31 to 36 months of age, resulting in an overall incidence rate of 39 percent (119/305 rats examined) (1981). Historical carcinogenicity data indicates that the tumor incidence rate for uterine carcinomas in untreated Wistar Han rats ranges from approximately 1 to 14 percent in standard chronic studies (Charles River Laboratories, 2011; Mitsumori *et al.*, 2001; Walsh and Poteracki, 1994). The average incidence rate of uterine carcinomas in Charles River Wistar Han rats across two chronic gavage studies recently completed for the National Institute for Environmental Health Sciences (NIEHS)/National Toxicology Program (NTP) ranged from a 4 to 18 percent (2 to 9 out of 50 animals per group). These NTP studies are in the process of being finalized (they are currently in review by the pathology working group at the NIEHS/NTP); however, these preliminary results will become publicly available once the review has been completed. Although an increasing dose response trend ( $p = 0.0117$ ) in the incidence of uterine carcinomas was identified for TB females in the current study, the incidence rate of the B5F group (12 percent) did not exceed the historical background range or average incidence reported for this strain; therefore, a treatment-related effect cannot be substantiated.

An increasing dose response trend was also observed for malignant mesothelioma in the epididymis of TB males. In one of sixteen 2-year carcinogenicity studies conducted by Charles River to determine the average incidence of tumor diagnoses in untreated Wistar Han rats, the average incidence of malignant mesotheliomas in the epididymides was 4 percent (2 out of a total of 50 tissues examined) (Charles River Laboratories, 2011). One of two chronic gavage NTP studies also reported the occurrence of a malignant mesothelioma in the epididymides for Wistar Han rats, in which two groups (untreated and treated) exhibited an average incidence rate of 2 percent (1 out of 50 animals per group). In the current study, an increasing dose response trend was observed statistically ( $p = 0.0045$ ); however, three tumors were observed in the B5M group and were not observed in either the B0.2M or B2M groups. The resulting tumor incidence rate of 5 percent (1 to 3 out of 60 animals per group) is comparable to that reported for this strain; thus a conclusive treatment-related effect cannot be substantiated.

A decreasing linear trend was observed for all other statistically significant dose responses in tumor incidence, including benign adenomas in the mammary gland of TB females, malignant basal cell skin carcinomas in TE females, and in benign follicular cell adenomas in the thyroid gland of TE males. Several chronic studies conducted by Charles River to determine the average incidence of tumor diagnoses in untreated Wistar Han rats indicates that the average incidence rate for malignant basal cell skin carcinomas ranges from 1 to 2 percent in females (across 3 studies); follicular cell adenomas in the thyroid gland of males ranges from 1 to 12 percent (across 13 studies); and background incidence for benign mammary gland adenomas in female Wistar rats ranged from 2 to 32 percent (across 15 studies) (Charles River Laboratories, 2011). In the current study, the average incidence rate for groups involved in statistically significantly *decreasing* trends ranged from 7 to 0 percent for malignant basal cell skin carcinomas in CF (4 of 60) and TE (0 of 60 at the highest dose) females; ranged from 12 to 0 percent for benign follicular cell adenomas in the thyroid gland of CM (7 of 58), CBM (7 of 59), and TE (0 of 60 at the highest dose) males; and ranged from 23 to 3 percent for benign adenomas in the mammary gland of CF (8 of 60), CBF (14 of 60), and TB (2 of 60 at the highest dose) females. Tumors with decreasing dose response trends and incidence rates were within the historical background range for Wistar Han rats, and were not interpreted to be treatment-related effects.

In conclusion, the only treatment-related finding identified in the chronic dosed feed toxicity and carcinogenicity study of tobacco blend and aqueous tobacco extract included a dose-proportional reduction in body weight for male and female Wistar Han rats. Although a dose-dependent reduction in body weight was seen among dosage groups, body weights were generally similar between TB and TE groups at comparable doses. Treatment-related reductions in food consumption were apparent among high dose females, but average food consumption per day for males exposed to the TB and TE test articles did not differ significantly from the control. When compared to the respective controls, all microscopic findings were typical of spontaneous background changes observed in untreated Wistar Han rats (Deerberg *et al.*, 1981; Mitsumori *et al.*, 2001; Son *et al.*, 2010; Charles River Laboratories, 2011), and were interpreted to be neither toxicologically nor biologically significant. None of the microscopic findings in this study were interpreted to be due to exposure to TB or TE test article administration, and the effects of the TB and TE test articles were generally similar between comparable doses.

Multiple comparisons were made according to the letters listed below. Capital letters indicate the comparison was significantly different at  $p \leq 0.05$  with Dunnett's test of significance; lower case letters indicate comparisons were significantly different at  $p \leq 0.05$  with Modified t-test.

A = CF vs. CBF, B0.2F, B2F, B5F, E0.2F, E2F, E5F.

B = Corresponding blend vs. extract dose groups (B0.2F vs. E0.2F, B2F vs. E2F, and B5F vs. E5F).

To the best of our knowledge, this study does not unnecessarily duplicate any previous experiments.

## **1.0 PURPOSE**

The purpose of this study is to compare toxicity of a tobacco blend, aqueous tobacco extract, and appropriate controls in rodents (diet negative control). The study will also include the determination of plasma concentrations of nicotine and cotinine under various conditions of test article exposure.

## **2.0 REGULATORY COMPLIANCE**

This study will be conducted in compliance with the current version of the United States Food and Drug Administration's (FDA) Good Laboratory Practice (GLP) Regulations, 21 CFR Part 58, for the conduct of nonclinical laboratory studies. This protocol will be listed in the Battelle total list of studies as "FDA GLP (non-regulated)."

All portions of this study to be performed at Battelle will adhere to the study protocol and any amendments, as well as to applicable Battelle facility Standard Operating Procedures (SOPs).

Portions of this study performed by the Sponsor or Sponsor's designee will be conducted according to SOPs of the performing laboratory. The conduct of such portions will be conducted in compliance with the current version of the United States Food and Drug Administration's (FDA) Good Laboratory Practice (GLP) Regulations, 21 CFR Part 58 for the conduct of nonclinical laboratory studies. The analytical portion of serology testing will be conducted under non-GLP regulatory guidelines.

## **3.0 ROUTE AND DURATION OF ADMINISTRATION**

The test articles will be administered orally in the feed. This route of administration is chosen based upon human exposure via the oral route. The toxicity phase of the study will consist of an interim time point (12 months) in which rats will be fed their respective diets for a minimum of 1 year (52 weeks). Animals in the carcinogenicity phase will be fed their respective diets for a minimum of 2 years (104 weeks).

Week [13 14] <sup>1</sup> :	June 2-3, 2009
Week 31:	September 29-30, 2009
Week 49:	February 2-3, 2010
Week 66:	June [1-2 2-3] <sup>4</sup> , 2010
Week 83:	September 28-29, 2010
Week 101:	February 1-2, 2011

**7.0 TEST SYSTEM**

Species:	Rat
Strain:	Wistar Hanover
Source:	Charles River
Anticipated Body Weight Range at Randomization:	50-200 g
Anticipated Age Range at Arrival:	4-5 weeks
Number of Rats Required for Study:	1440 rats (720/sex), including sentinels. A sufficient number of extra rats will be ordered to provide the required number of rats for the study.

**7.1 Test System Justification**

The rat is an accepted rodent species for inclusion in toxicology studies of test articles which are intended for human use. At this time, studies in laboratory animals are required to support regulatory submissions. The number of rats is considered to be the minimum number necessary to yield meaningful results.

**8.0 ANIMAL CARE, HOUSING, AND ENVIRONMENTAL CONDITIONS**

General procedures for animal care and housing will meet or exceed current AAALAC recommendations, current requirements stated in the "Guide for Care and Use of Laboratory Animals" (National Research Council, 1996), and will conform to the Testing Facility Standard Operating Procedures (SOPs). The protocol will be reviewed and approved by Battelle's Institutional Animal Care and Use Committee (IACUC) and will be reviewed by the Sponsor's IACUC, and Battelle will respond to any written comments and/or questions from the Sponsor's IACUC regarding the protocol.

### **8.1 Quarantine and Acclimation**

Rats will be quarantined and acclimated for not less than 7 days in accordance with facility SOP.

### **8.2 Animal Housing**

All animal housing and environmental conditions will follow facility SOPs. Male rats will be housed up to two per cage and female rats will be housed up to three per cage in polycarbonate cages appropriate for the animals and the study. Sentinel rats for serological monitoring will be housed in the same room as the study rats.

### **8.3 Feed**

Rats will be fed powdered NTP-2000 rodent diet *ad libitum*, according to facility SOP, except when fasted prior to scheduled necropsy. The control group will be fed the diet without test article. Analytical reports of each feed lot will be provided by the manufacturer. Analytical reports will be reviewed according to facility SOP to ensure acceptable standards, and freedom from levels of contaminants that may interfere with the purpose or conduct of the study. Copies of the analytical results will be retained in the study file.

### **8.4 Water**

Fresh water from the Columbus municipal water supply will be provided *ad libitum* to the rats by an automatic watering system. The water supply will be analyzed within 6 months from the start of the study to ensure acceptable standards, and freedom from levels of contaminants that may interfere with the purpose or conduct of the study. A copy of the analytical results will be retained in the study file.

## **9.0 TEST ARTICLE**

Records of receipt and use of the test article will be maintained.

### **9.1 Test Articles**

#### **9.1.1 Tobacco Blend**

Description: Natural tobacco blend containing no additives

Supplier: R.J. Reynolds Tobacco Company

Characterization: A Certificate of Analysis (CoA) and/or equivalent documentation of test article identity, strength, purity, composition and other defining characteristics was provided by the Sponsor. Documentation of production will be maintained by the Sponsor. Lot number(s) and

expiration date(s), if any, will be included in the final report and study files.

Stability:	Test article stability was provided by the Sponsor for inclusion in the final report.
Storage Conditions:	Suitable quantities of the test article were provided by the Sponsor in plastic buckets. The test article will be stored frozen (-30 to -15°C). Any test article from a single-use container that is not used for the formulation task for which it was aliquoted will be saved for emergency use only.

#### **9.1.2 Aqueous Tobacco Extract**

Description:	Water extraction of tobacco test article
Supplier:	R.J. Reynolds Tobacco Company
Characterization:	A Certificate of Analysis (CoA) and/or equivalent documentation of test article identity, strength, purity, composition and other defining characteristics was provided by the Sponsor. Documentation of production will be maintained by the Sponsor. Lot number(s) and expiration date(s) will be included in the final report.
Stability:	Test article stability was provided by the Sponsor for inclusion in the final report.
Storage Conditions:	Suitable quantities of the test article were provided by the Sponsor in plastic buckets. The test article will be stored frozen (-30 to -15°C). Any test article from a single-use container that is not used for the formulation task for which it was aliquoted will be saved for emergency use only.

#### **9.2 Reserve Samples**

Archival samples (~100 g) of each set of the tobacco blend and aqueous tobacco extract were collected under design form CN49730 A-TASTAB. Reserve samples of the tobacco blend and tobacco extract will be maintained frozen (-30 to -15°C) until submission of the chronic study final report. At that time, reserve samples will be shipped to R.J. Reynolds Tobacco Company upon authorization by the Study Director. Samples will be shipped overnight on dry ice to:

R.J. Reynolds Tobacco Company  
Research and Development  
Bowman Gray Technical Center  
Winston Salem, NC 27102

The Study Monitor will be notified of the date of shipment.

#### **9.2.1 Disposition of Unused and Residual Test Articles**

Following the completion of in-life dosing, the Sponsor will provide the laboratory authorization to either dispose of or directions to store unused test article for potential use in further studies. If for any reason, the subsequent studies are cancelled, the Sponsor will provide Battelle authorization to either dispose of these materials or have them returned to the Sponsor.

### **9.3 Formulation Preparation and Analysis**

#### **9.3.1 Formulation Preparation**

Diet formulations will be prepared at approximately monthly intervals for the first three preps and bi-monthly thereafter according to a procedure developed by Battelle for this study, based on method(s) provided by the Sponsor. The concentration of test article in the feed will be based upon the anticipated food consumption in and body weight changes of Wistar Han rats to maintain a constant dose throughout the study. Exposure of the animals to the test articles and will be by *ad libitum* consumption of the NTP-2000 powdered feed. Formulations will be stored at room temperature prior to use and will be appropriately discarded on or after their expiration date. Stability of formulations was conducted under design form CN49730A-FORMPRE.

#### **9.3.2 Retention Samples**

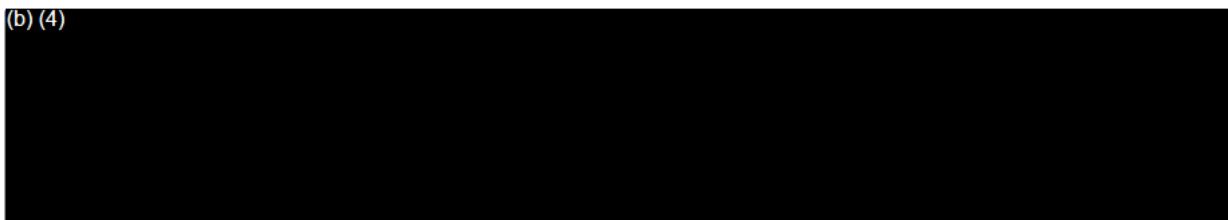

One formulation analysis sample, target 200 g, and one formulation retention sample, target 200 g, will be taken from the formulation batches prepared for each diet at each dose and will be stored at room temperature. Formulation retention samples will be retained until the analysis is complete and acceptable to the Study Director or after the dose expires, whichever occurs first.

#### **9.3.3 Formulation Analysis**

Nicotine will be used as the tracking compound for the formulation analysis. All prepared formulations will be analyzed for nicotine content. Animal room samples will be collected once on the last day of use of the first formulation preparation. Homogeneity of dose formulations will be conducted during the first formulation and during subsequent formulations as necessary according to facility SOPs.

Results of formulation analyses and an audited formulation analysis report will be included in the final report.

(Amended 3/09<sup>1</sup>, 1/11<sup>6</sup>)**10.1 Serology**

The serology screen will be conducted using 5 males and 5 females soon after arrival. These animals will be necropsied to evaluate the internal organs for any signs of

disease. Initiation of the study will be dependent on negative serology and no evidence of disease in the animals. This procedure will be repeated at approximately 1, 6, 9, and 14 months of the study, and again near or at termination of the study.

Rat serology endpoints are as follows:

Sendai virus	Mouse adenovirus (MAV) 1 & 2
Pneumonia virus of mice (PVM)	Hantaviruses (HANT)
Sialodacryoadenitis virus (SDAV)	<i>Encephalitozoon cuniculi</i> (ECUN)
Kilham rat virus (KRV)	Cilia associated respiratory bacillus (CARB)
H-1 virus (H-1)	Mouse parvovirus (MPV) or PARV NS1
GDVII (murine encephalomyelitis virus)	Rat parvovirus (RPV)
REO	Rat minute virus (RMV)
<i>Mycoplasma pulmonis</i>	
Lymphocytic choriomeningitis virus (LCMV)	

## 10.2 Assignment to Groups

Rats will be assigned to dose groups by sex and body weight prior to the initiation of dosing using PATH/TOX SYSTEM 4.2.2. (Xybion Medical Systems Corp., Cedar Knolls, NJ), which ensures similar group mean body weights by sex. Rats whose body weights are outside a suitable range based on the mean body weights of the animals will not be assigned to the study upon the judgment of the study director. Animals whose behavior or clinical condition deviates from that typical of the species and strain will be eliminated from use on the study. After randomization, the mean body weights of each study group will not be significantly different ( $p \leq 0.05$ ). After assignment to groups, each rat will be identified by tail tattoo with an animal identification number unique within the study. Each cage card will contain information including but not limited to study number, group assignment, and animal identification number.

Animal identification numbers will be assigned as follows:

### 10.3 Clinical Observations

Cage-side observations for moribundity and mortality will be performed on all rats twice daily, at least 6 hours apart, per facility SOP.

Detailed clinical examinations will be conducted on all rats, including those not subsequently assigned to study, prior to group assignment. During the in-life phase of the study, detailed clinical examinations will be conducted weekly on all surviving core study rats. A final detailed clinical examination of each core study rat will be conducted on the day of its scheduled necropsy. Clinical observations will be conducted for all core moribund animals. Clinical observations will not be conducted for TK animals.

### 10.4 Body Weight

Individual animal body weights will be recorded for all rats pre-study for randomization and group assignment. After initiation of dosing, body weights for all core study rats (excluding sentinels) [*and rats in the TK plasma analysis groups*]<sup>1</sup> will be recorded weekly for the first 13 weeks and every 4 weeks thereafter until termination. [*Weekly body weights will also be recorded for animals in the TK plasma analysis groups.*]<sup>1</sup>

### 10.5 Food Consumption

Food consumption over an approximate 24 hour period (24 hour food consumption over a 1 week period) for core study rats will be measured weekly for 13 weeks and every 4 weeks thereafter until termination. Food consumption will not be measured on TK animals or sentinels.

Page 12 of 18

Preparation Date: February 12, 2009

(Amended 3/09<sup>1</sup>, 1/11<sup>6</sup>)

#### 10.6 Ophthalmic Examinations

Ophthalmic examinations will be conducted on all potential core carcinogenicity animals according to facility SOP by a staff veterinarian prior to selection/group assignment. Ophthalmic exams will also be performed after 12 months and near the termination of the carcinogenicity phase for all core carcinogenicity study animals, excluding [*the Control-B group and*]<sup>1</sup> sentinels. A mydriatic will be used for ophthalmic exams. A copy of the ophthalmic examination findings will be included in the final report.

#### 10.7 Toxicokinetics

Ten rats per sex are included in each dose group, excluding the Control-B group, for determinations of plasma nicotine and cotinine concentrations. Methodology for plasma nicotine and cotinine analysis were validated under design form CN49730 A-BIOVAL.

[Blood sampling **Toxicokinetic plasma collection**]<sup>1</sup> will occur on each Tuesday (males) and Wednesday (females) [~~immediately following on~~]<sup>1</sup> Weeks 5, 14, and every 4 months thereafter (Weeks 31, 49, 66, 83, and 101). Samples will be collected at a single time point (12:00 AM) for nicotine and cotinine analysis in five male and five female rats from up to seven dose groups at each of the four time periods (35 total TK samples/sex/time period). Five extra rats have been included in each dose group for potential replacement of any rat that may die or be unsuitable for blood sampling. The data from each sampling period will be used to evaluate dose proportionality and nicotine metabolism by sex and group.

Toxicokinetic study rats will be anesthetized with CO<sub>2</sub>/O<sub>2</sub> and blood will be collected retro-orbitally into tubes containing potassium EDTA as the anti-coagulant. A target volume of 500 µL of blood will be collected at each time point using techniques according to facility SOPs. Samples will be placed on wet ice until centrifuged. Plasma will be transferred into appropriately labeled tubes and placed on dry ice until stored in a freezer set to maintain -60 to -80°C.

After each blood collection the animal will be placed back in its home cage and supplied with feed and water until the next scheduled blood collection. These animals will remain on the study and be used for subsequent plasma nicotine and cotinine analysis. Toxicokinetic animals will be euthanized [~~at termination of the study after the last collection day~~]<sup>6</sup> with no further data collected.

Toxicokinetic parameters to be evaluated will include but may not be limited to the measured C<sub>max</sub> and T<sub>max</sub>. An audited toxicokinetic report and an audited bioanalytical report, together with appropriate QA documentation, will be provided to the Study Director for inclusion in the final report.

## 10.8 Clinical Pathology

Clinical chemistry, hematology and coagulation assessments will be performed on all surviving core study rats (excluding sentinels) on the day of their scheduled necropsy at the termination of the 12-month chronic toxicity phase. Urinalysis will be conducted for 10 surviving core study rats per sex per dose group. No clinical pathology studies will be conducted on carcinogenicity rats at the termination of the carcinogenicity phase.

All rats will be fasted overnight prior to scheduled blood sampling for hematology, coagulation, and clinical chemistry determinations. Rats will be anesthetized and blood will be collected using an appropriate method. The tubes for hematology will contain EDTA as an anticoagulant. The tubes used for clinical chemistry determinations will not contain anticoagulant, but may contain serum separator gel. Sodium citrate will be used as an anticoagulant for the coagulation assay. Minimum target volumes of blood collections for clinical chemistry, hematology and coagulation are 1.1, 0.5, and 1.3 mL, respectively. In the event that blood volumes do not meet these suggested values, clinical chemistry and coagulation parameters will be given the highest and lowest priority, respectively. Further prioritization may be assigned to clinical chemistry parameters based upon anticipated target organs (see below).

Rats will be placed into metabolism cages for urine collection. Water, but no food, will be provided to the animals. Urine will be collected overnight according to facility SOPs.

Clinical pathology results, and the clinical pathologist's report, will be included in the final report.

### 10.8.1 Clinical Chemistry Parameters

Clinical chemistry parameters to be evaluated are (listed in the order of priority left column top to bottom, then right column top to bottom):

Aspartate aminotransferase	Cholesterol
Bilirubin, direct	Creatinine
Bilirubin, total	Protein, total
Gamma glutamyl transferase	Urea nitrogen
Albumin	Electrolytes:
Globulin	Calcium
Albumin/globulin ratio	Chloride
Alkaline phosphatase	Phosphorus
Glucose	Potassium
Triglycerides	Sodium

#### 10.8.2 Hematologic Parameters

Hematologic parameters to be evaluated are:

Erythrocyte count	Mean corpuscular hemoglobin concentration
Hematocrit	Mean corpuscular volume
Hemoglobin	Platelet count
Leukocyte count, total	Reticulocyte count
Leukocyte differential	
Mean corpuscular hemoglobin	

#### 10.8.3 Coagulation Parameters

Prothrombin time will be evaluated.

#### 10.8.4 Urinalysis

Urinalysis parameters to be evaluated are (listed in the order of priority left column top to bottom, then right column top to bottom):

Appearance	Glucose
Color	Protein
Volume	Specific gravity
pH	Microscopic examination of sediment <sup>a</sup>

<sup>a</sup> Sediment will be evaluated for white blood cells, red blood cells, casts, epithelial cells, mucus, sperm, bacteria, yeast, amorphous sediment, and crystals.

### 10.9 Necropsy

#### 10.9.1 Unscheduled Necropsy

Complete necropsies will be performed on all core study rats that die or are terminated at an unscheduled interval. Terminal body weights and clinical observations will be recorded for moribund core rats prior to euthanasia. Moribund core rats will be euthanized using CO<sub>2</sub>. Organ weights will not be recorded for

Page 15 of 18

(Amended 4/10<sup>2</sup>)

unscheduled deaths. Necropsy and clinical observations will not be conducted on sentinels and toxicokinetic rats that die or are terminated at an unscheduled interval.

#### 10.9.2 Scheduled Necropsy

At the end of the chronic toxicity phase and the carcinogenicity phase, all surviving core animals, excluding sentinels, will be fasted overnight and humanely terminated via exsanguination (12-month toxicity study) or CO<sub>2</sub> (carcinogenicity study). A final clinical observation will evaluate the external features of the animal. Terminal body weights will then be determined, followed by necropsy.

All scheduled necropsies will be conducted under the supervision of a board-certified veterinary pathologist. Each necropsy will include examination of the external surface of the body and all orifices; the cranial, thoracic, abdominal and pelvic cavities and their contents; and collection of tissues.

Tissues listed below, when present, will be collected from all rats according to facility SOP. Tissues will be placed in 10% neutral buffered formalin (NBF), with the exception of testes, which will be preserved in Bouin's fixative and subsequently transferred to 70% ethanol, and eyes with optic nerve which will be fixed in Davidson's fixative and subsequently transferred to 10% NBF, per facility SOP.

Animal identification <sup>a</sup>	Pituitary gland
Adrenal glands	Preputial glands
Bone and marrow (femur)	Prostate gland
Brain	Salivary gland (mandibular)
Clitoral gland	Sciatic nerve
Epididymides	Seminal vesicles
Esophagus, pharynx, trachea	Skeletal muscle (biceps femoris)
Eyes	Skin
Gross lesions	Spinal cord (cervical, thoracic, lumbar)
Harderian glands	Spleen
Heart	Sternum with bone marrow
Intestine, large (cecum, colon, rectum)	Stomach (fore-stomach and glandular)
Intestine, small (duodenum, jejunum, ileum)	Testes
Kidneys	Thymus
Liver (median lobe and left lateral lobe)	Thyroid gland (with parathyroids, if present in routine section)
Lungs with bronchi	Tongue
Lymph node (mesenteric)	Urinary bladder
Mammary gland (females only)	Uterus
Nose (nasal cavity and turbinates)	Vagina
Ovaries (without oviduct)	Zymbal glands
Oral [eavity mucosa] <sup>2</sup>	
Pancreas

### 10.10 Organ Weights

The following organs, when present, will be weighed during scheduled necropsies for the 12-month chronic toxicity phase of the study. Paired organs will be weighed together. Absolute weight, organ-to-body weight and organ-to-brain-weight will be reported. Organ weights will not be conducted on rats found dead or euthanized in moribund condition.

Adrenal glands	Thyroid/parathyroid gland <sup>a</sup>
Brain	Seminal vesicles <sup>a</sup>
Epididymides	Spleen
Heart	Ovaries (without oviduct)
Kidneys	Testes (without epididymides)
Liver	Thymus
Lungs	Salivary glands (mandibular)
Pituitary gland <sup>a</sup>	Uterus (with cervix)
Prostate <sup>[a]</sup> <sup>1</sup>	

<sup>a</sup> Weighed after fixation.

### 10.11 Tissue Processing

All fixed tissues [*of the 12-month toxicity animals*]<sup>6</sup> from controls (Group 1) and high dose groups (Groups 5 and 8) will be processed to slides[. and *All fixed tissues of the 24-month carcinogenicity animals from controls (Group 1) and all dose groups (tobacco blend and tobacco extract) will be processed to slides. Slides will be*]<sup>6</sup> stained with hematoxylin and eosin according to facility SOP for histopathologic examination. [~~*Tissues collected from Control-B (Group 2) will not be processed to slides and stained unless authorized by the Sponsor. Tissues collected from Control-B (Group 2) will be processed to slides and stained with hematoxylin and eosin according to facility SOP for histopathologic examination.*~~<sup>7</sup> This additional processing will be performed for additional cost and time, which will require modifications of the report timeline.]<sup>6</sup>

### 10.12 Histopathologic Evaluation

Tissue slides from [*all unscheduled and*]<sup>6</sup> scheduled necropsies of core rats in the [*12-month toxicity*]<sup>6</sup> Control-A (Group 1) and high dose groups (Group 5 for tobacco blend and Group 8 for tobacco extract) will be examined histologically by a board-certified veterinary pathologist. [*Tissue slides from all unscheduled and scheduled necropsies of core rats in the 24-month carcinogenicity Control-A group (Group 1) and all dose groups (tobacco blend and tobacco extract) will be examined histologically by a board-certified veterinary pathologist.*]<sup>6</sup> Tissues collected from Control-B (Group 2) will [not]<sup>7</sup> be examined histologically [*unless authorized by the Sponsor by a board-certified veterinary pathologist*]<sup>7</sup>.

[Additional groups may be included for histological examination at the discretion of the Sponsor.]<sup>6</sup> These additional examinations will be performed for additional cost and time, which will require modifications of the report timeline.

An internal peer review will be performed according to Battelle SOP.

Necropsy and histopathology results and the pathologist's report will be included in the final report.

## **11.0 COMPUTER SYSTEMS FOR DATA MANAGEMENT**

The following computer systems will be used for the conduct of this study:

## 12.0 STATISTICAL ANALYSIS

All appropriate quantitative in-life, clinical pathology, and postmortem data collected at Battelle will be analyzed statistically when  $n \geq 3$ . All data will be analyzed for test article effects by analysis of variance. For homogeneous data, as determined by Bartlett's test for homogeneity at the 0.05 level, tests for differences between the control and comparison groups will be made using Dunnett's, LSD or Modified t-test. For non-homogeneous data, as determined by Bartlett's test for homogeneity at the 0.05 level, tests for pairwise differences between the control and each of the comparison groups will be made using Cochran and Cox's modified two-sample t-test. Statistical significance for each comparison will be reported at the 0.05 level. Comparisons will include Control-A vs. Test Articles and Blend vs. Extract. Qualitative data summaries will be provided for clinical observations.

Toxicokinetic data will be reported as individual and group mean summary graphs and tables prepared by species, sex, treatment, and time period.

[PETO's *Trend*]<sup>8</sup> tests will be used for carcinogenicity data analysis. Each tumor observed in each animal will be classified by the pathologist as either incidental, fatal, or mortality independent. Nonlethal occult tumors will be classified as incidental tumors, which do not contribute to the death of the animal. Tumors that are assumed to have caused the death of an animal will be classified as fatal tumors. Tumors present at termination, which therefore could not have been responsible for the animal's death and yet can also not be assumed to be incidental, will be classified as mortality independent tumors. When a tumor is observed in a fatal context for some animals, and an incidental context for the other animals, PETO's tests, both in

asymptotic and exact per mutation versions, will be used to test for positive linear dose trends in tumor incidences. These tests will be also used to conduct pairwise comparisons to the vehicle control group.

### **13.0 REPORTING**

A draft final report will be prepared and submitted to the Sponsor as a .pdf file via email. The Sponsor shall submit final comments, if any, on the draft report to the

Study Director. After review and acceptance of the draft final report by the Sponsor, Battelle will submit to the Sponsor a bound final report along with a .pdf file.

#### **14.0 STORAGE OF STUDY MATERIALS AND RECORDS RETENTION**

Except for analyses performed by the Sponsor or Sponsor's designated laboratory, all records required to reconstruct the study and the final report will be maintained under the direction of Battelle according to facility SOPs. The final report, study files, records and specimens will be stored in Battelle's archives for a period of no less than one year after issue of the final report. At the end of 1 year, the Sponsor will provide authorization concerning the disposition of these items.

**AMENDMENT NUMBER 6 TO THE PROTOCOL FOR THE 2-YEAR CHRONIC  
TOXICITY/CARCINOGENICITY STUDY OF TOBACCO BLEND AND AQUEOUS  
TOBACCO EXTRACT IN WISTAR HAN RATS (CN49730G)**

1. a. Page 9, Section 10.0, **EXPERIMENTAL DESIGN**. The following sentence has been added to the end of the first complete paragraph:

“Control toxicokinetic animals may be used to fulfill serological monitoring requirements after the final toxicokinetic plasma collection.”

- b. The reason for this change is to allow control toxicokinetic animals to be used for terminal serological monitoring if there are not enough sentinels to fulfill the 5 animals per sex for testing.

- c. The effective date for this change is January 21, 2011.

2. a. Page 12, Section 10.7, **Toxicokinetics**. The last sentence of the fourth paragraph has changed from:

“Toxicokinetic animals will be euthanized at termination of the study with no further data collected.”

to:

“Toxicokinetic animals will be euthanized after the last collection day with no further data collected.”

- b. The reason for this change is to allow termination of the toxicokinetic animals after all collections have been completed and prior to study termination.

- c. The effective date for this change is January 10, 2011.

3. a. Page 16, Section 10.11, **Tissue Processing**. The section has changed from:

“All fixed tissues from controls (Group 1) and high dose groups (Groups 5 and 8) will be processed to slides and stained with hematoxylin and eosin according to facility SOP for histopathologic examination.”

to:

“All fixed tissues of the 12-month toxicity animals from controls (Group 1) and high dose groups (Groups 5 and 8) will be processed to slides. All fixed

tissues of the 24-month carcinogenicity animals from controls (Group 1) and all dose groups (tobacco blend and tobacco extract) will be processed to slides. Slides will be stained with hematoxylin and eosin according to facility SOP for histopathologic examination. Tissues collected from Control-B (Group 2) will not be processed to slides and stained unless authorized by the Sponsor. This additional processing will be performed for additional cost and time, which will require modifications of the report timeline.”

- b. Page 16, Section 10.12, **Histopathologic Evaluation**. The first paragraph has changed from:

“Tissue slides from scheduled necropsies of core rats in the Control-A (Group 1) and high dose groups (Group 5 for tobacco blend and Group 8 for tobacco extract) will be examined histologically by a board-certified veterinary pathologist. Tissues collected from Control-B (Group 2) will not be examined histologically unless authorized by the Sponsor. Additional groups may be included for histological examination at the discretion of the Sponsor. These additional examinations will be performed for additional cost and time, which will require modifications of the report timeline.”

to:

“Tissue slides from all unscheduled and scheduled necropsies of core rats in the 12-month toxicity Control-A (Group 1) and high dose groups (Group 5 for tobacco blend and Group 8 for tobacco extract) will be examined histologically by a board-certified veterinary pathologist. Tissue slides from all unscheduled and scheduled necropsies of core rats in the 24-month carcinogenicity Control-A group (Group 1) and all dose groups (tobacco blend and tobacco extract) will be examined histologically by a board-certified veterinary pathologist. Tissues collected from Control-B (Group 2) will not be examined histologically unless authorized by the Sponsor. These additional examinations will be performed for additional cost and time, which will require modifications of the report timeline.”

- c. The reasons for these changes are to add additional tissue processing and histopathologic evaluation of core 24-month carcinogenicity groups, to clarify that Control-B (Group 2) tissues will not be processed to slides and stained unless authorized by the Sponsor, and to add the histopathologic evaluation of tissue slides from unscheduled necropsies.
- d. The effective date for these changes is January 10, 2011.

## DEVIATION REPORT

CN49730G

2-Year Chronic Toxicity/Carcinogenicity Study of Tobacco Blend and Aqueous Tobacco Extract  
in Wistar Han Rats

Type of Deviation: Protocol

Dates of Deviation: February 17, 2009 – February 24, 2009 (Pre-study period).

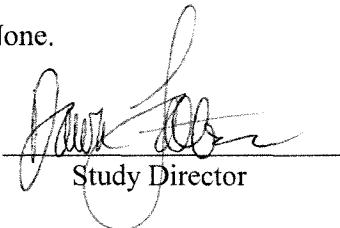

Nature of Deviation: According to Section 10.3 of the study protocol, detailed clinical examinations were to be conducted on all rats, including those not subsequently assigned to study, prior to group assignment.

Cause of Deviation: Clinical observations were not scheduled to occur in the TOX/PATH SYSTEM until Study Day 1 for male and female rats.

Impact on the Study: None. Only animals with “unremarkable” clinical observations on Study Day 1 were selected for group assignment.

Corrective Action: None.

2-Year Chronic Toxicity/Carcinogenicity Study of Tobacco Blend and Aqueous Tobacco Extract  
in Wistar Han Rats

Type of Deviation: Protocol

Dates of Deviation: February 17, 2009-March 2, 2009

Nature of Deviation: Protocol states male rats will be housed up to 2/cage and females will be housed up to 3/cage. Animals were housed up to 5/cage upon receipt.

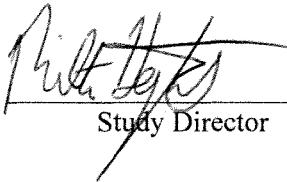

Cause of Deviation: In order to coordinate and consolidate the receipt of animals while additional study rooms were being prepared prior to the study start, rats were separated by sex into two study rooms and were housed up to 5/cage to facilitate adaptation and acclimatization to the cage environment.

Impact on the Study: This deviation has no impact on the study. IACUC approval for this initial housing modification was received on February 20, 2009.

Corrective Action: None.

## DEVIATION REPORT

CN49730G

2-Year Chronic Toxicity/Carcinogenicity Study of Tobacco Blend and Aqueous Tobacco Extract  
in Wistar Han Rats

Type of Deviation: Protocol

Dates of Deviation: March 2-29, 2009

Nature of Deviation: Within each dose group, male rats were fed the concentration of test article in feed that was intended for females, and vice versa, from the first formulation.

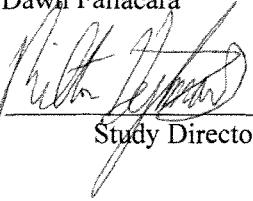

Cause of Deviation: The color code included in Table 1 of COMPSPEC.I-185-00 indicated red buckets were to be used for male dose formulations and blue buckets were to be used for female dose formulations. The SOP should have indicated that blue buckets were to be used for male doses and red buckets were to be used for female doses to maintain consistency with the 28-Day and 90-Day studies.

Impact on the Study: This incident has no impact on the study as the body weights and dose concentrations were similar between sexes and corresponding dose groups. Exposure information is included in the table below. The estimated concentrations (mg nicotine/kg BW/day) were derived from actual food consumption and body weight data using the intended concentrations while the exposure concentration denotes the concentration fed to rats.

Group	Estimated Concentration	Exposure Concentration
B0.2M	0.15	0.18
B2M	1.5	1.8
B5M	3.7	4.3
B0.2F	0.16	0.13
B2F	1.5	1.3
B5F	3.7	3.1
E0.2M	0.18	0.21
E2M	1.8	2.1
E5M	4.2	4.9
E0.2F	0.18	0.16
E2F	1.8	1.5
E5F	4.3	3.6

Corrective Action: The color coding system has been changed for the second formulation to indicate blue buckets for female rats and red buckets for male rats.

CN49730G

2-Year Chronic Toxicity/Carcinogenicity Study of Tobacco Blend and Aqueous Tobacco Extract  
in Wistar Han Rats

Type of Deviation: Protocol

Dates of Deviation: September 18, 2009

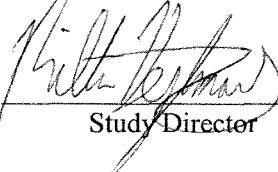

Nature of Deviation: Protocol states that the formulation archive/retention samples are to be stored at room temperature; however, the labels indicated -20°C storage conditions.

Cause of Deviation: Labeling error in ToxForm.

Impact on the Study: No negative impact on study.

Corrective Action: Labels used for the September 2, 2009 were GLP-corrected prior to sample storage. Blend samples obtained from the previous day's formulation (September 1, 2009) were moved to the correct location.

Type of Deviation: Protocol

Dates of Deviation: October 26-29, 2009 (Batch 11 dose formulation)  
December 18-21, 2009 (Batch 12 dose formulation)

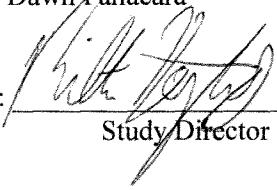

Nature of Deviation: The protocol states that the formulation archive/retention samples are to be stored at room temperature. At the time of dose formulation, the archival/retention sample labels were mislabeled and indicated -20°C storage conditions. Therefore, Batch 11 and Batch 12 archival/retention samples were periodically stored in the freezer prior to being moved to the correct storage conditions.

Cause of Deviation: Labeling error in ToxForm.

Impact on the Study: No negative impact on study.

Corrective Action: Archive sample labels were GLP-corrected. Archival/retention samples were moved to the correct location (room temperature).

Deviation Classification:

GLP  
 Protocol  
 SOP

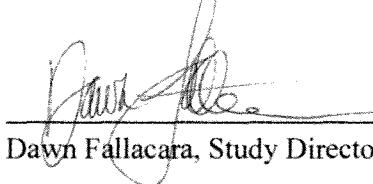

Date(s) of Deviation: July 25, 2009-August 18, 2009

Description of Deviation: The protocol states that the bulk test articles are to be stored at -30 to -15°C. The T-track report for freezer X58801 indicates 115 readings were outside the designated range (-14 to 2°C) from July 25, 2009-August 18, 2009.

Corrective Action: This report has been prepared as documentation.

Impact on Study: None. The freezer maintained below-freezing temperatures (< 0 °C) when out of range. The tobacco extract test article is an aqueous solution; therefore, thawing is highly unlikely within the temperature range -14 to 2°C. There was no evidence of thawing for the tobacco blend test article.

## DEVIATION REPORT

CN49730G

2-Year Chronic Toxicity/Carcinogenicity Study of Tobacco Blend and Aqueous Tobacco Extract  
in Wistar Han Rats

Type of Deviation: Protocol

Dates of Deviation: June 1, 2010

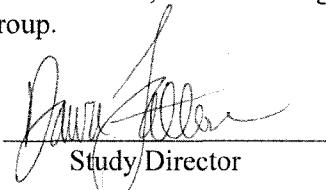

Nature of Deviation: Empty feeder weights were not recorded for cages # 393-400. When the error was recognized, feeders had already been removed from their respective cages, and there was no way to identify the location of each feeder prior to its removal.

Cause of Deviation: Technician error.

Impact on the Study: This incident has no negative impact on the study. Food consumption measurements for these eight cages will consist of three days of food consumption measurements as opposed to seven.

Corrective Action: The animal room technician correctly marked each empty feeder weight as "Not Taken" in the PATH/TOX SYSTEM. This will allow for food consumption measurements to be calculated using only the first three days of food consumption measurements, as feeder weights are currently weighed "on" and "off" twice a week. The remainder of the feeders in this group will be calculated using seven days of food consumption measurements, and the final group mean will include all cages within the group.

Type of Deviation: Protocol

Dates of Deviation: The actual dates of the deviation cannot be ascertained since it encompasses examination of tissue by the study pathologist. The deviation was identified on September 14, 2010.

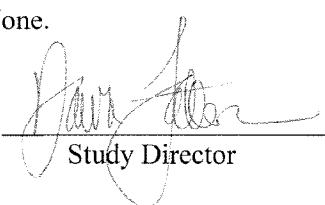

Nature of Deviation: According to Section 10.12 of the study protocol, histopathology examination was required for scheduled necropsies of core rats in the Control-A and high dose groups (Groups 5 and 8). Tissues collected from animals 504, 1516, 1802, and 1809 during unscheduled necropsies were also subjected to histopathology examination.

Cause of Deviation: Unscheduled deaths of animals 504, 1516, 1802, and 1809 occurred during the latter portion of the toxicity study (Days 142-353). Histopathology examination of tissues collected from these high-dose animals was conducted in order to document treatment-related microscopic findings.

Date(s) of Deviation: April 7, 2010

Description of Deviation: Serological samples collected on April 7, 2010 were not analyzed for the following endpoints as required per protocol.

GDVII (murine encephalomyelitis virus), REO, Lymphocytic choriomeningitis virus (LCMV), Mouse adenovirus (MAV) 1 & 2, Hantaviruses (HANT), *Encephalitozoon cuniculi* (ECUN), Cilia associated respiratory bacillus (CARB), Mouse parvovirus (MPV) or PARV NS-1.

Corrective Action: None. Upon acknowledgement of this error, there were no remaining sera with which to run the additional serological endpoints. Therefore, only the typical screening panel is available for the 14-month serology assessment.

Impact on Study: There is no negative impact on the study. Serology at study termination (February 2, 2011) was negative for all endpoints including GDVII, REO, LCMV, MAV, HANT, ECUN, CARB, MPV, and PARV NS-1.

2/1/11, 2/2/11, 2/3/11 (week 101 blood collection)

Description of Deviation:

The study protocol (Section 10.7) states that a target volume of 500 µL of blood will be collected from rats at each toxicokinetic (TK) time point. During the TK blood collections during weeks 66, 83, and 101, the minimum target volume was increased to 1 mL in order to provide a more substantial bioanalytical sample for plasma nicotine and cotinine analysis.

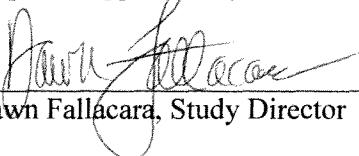

Corrective Action:

None.

Impact on Study:

There is no adverse impact of this deviation on the study. Increasing the target blood collection volume once the animals reached a larger body size allowed for duplicate samples to be more readily obtained, as necessary, for bioanalytical analyses.

Date(s) of Deviation: February 2, 2011

Description of Deviation: Serological samples collected on February 2, 2011 were not analyzed for the following endpoints as required per protocol:  
Murine encephalomyelitis virus (GDVII)  
Mouse adenovirus (MAV) 2  
*Encephalitozoon cuniculi* (ECUN)  
*Mouse parvovirus (MPV)* or *PARV NS1* DMF 8/2/11  
Furthermore, *Clostridium piliforme* was performed as an extra analysis in addition to the protocol-required endpoints.

Corrective Action: None. Upon acknowledgement of this error, there were no remaining sera with which to run the additional serological endpoints.

Impact on Study: The impact on study is negligible. All other serological endpoints were negative and included a typical screening panel for rats. The inclusion of *Clostridium piliforme* in the final serology screening has no adverse effect on the study.

### **VI. REGULATORY STANDARDS**

Good Laboratory Practices (GLP) for Nonclinical Laboratory Studies, U.S. Code of Federal Regulations, 21 CFR Part 58, September 4, 1987. (not for product registration)

### **VII. TEST ARTICLES**

The test articles for this study will be tobacco blend, and aqueous tobacco extract. These test articles and samples from these test articles will be stored at approximately -20°C.

**VIII. REPACKAGING**

During repackaging the aqueous tobacco extract and tobacco blend will only be thawed once to repackage it for single use containers for all of the studies.

**A. INITIAL AND 28-DAY STUDIES**

A sufficient amount of each test article will be removed from storage to take stability samples and repackage into containers suitable for single use on the 28-day studies.

**B. 90-DAY STUDIES**

A sufficient amount of each test article will be removed from storage to repackage into containers suitable for single use on the 90-day studies.

**C. 2-YEAR STUDY**

A sufficient amount of each test article will be removed from storage to repackage into containers suitable for single use on the two-year study.

**IX. STABILITY STUDY**

Test article stability will be conducted on both the tobacco blend and the aqueous tobacco extract.

**A. INITIAL ANALYSIS**

Prior to shipping the tobacco blend and the aqueous tobacco extract to Battelle RJR submitted samples for analysis. The results from this analysis will be provided to Battelle for inclusion in this report

**B. SUBSEQUENT PLANNED ANALYSES**

Battelle will submit samples of the tobacco blend and aqueous tobacco extract to both RJR and Labstat International ULC (Kitchener, Ontario, Canada) for analysis (the analysis to be conducted will be specified by the sponsor prior to sample submittal) after approximately one year (around May 2009) and after approximately two years (around May 2010). The results from each subsequent analysis will be compared to the initial analysis value to determine if they disagree significantly from the initial analysis value. These results will be reported to the sponsor in a timely manner and included in the report.

**C. ADDITIONAL ANALYSIS**

Battelle will submit additional samples (in the same manner as described for subsequent planned analyses) as directed by the sponsor.

**X. RECORDS TO BE MAINTAINED**

All records produced or submitted to Battelle will be maintained under the direction of Battelle in the archives according to SOPs.

**XI. STATISTICAL METHODS**

Simple statistical endpoints that may be calculated include standard deviation, percent relative standard deviation (%RSD), and percent relative error (%RE).

**AMENDMENT 1 FOR STUDY DESIGN FORM FOR THE HANDLING AND STABILITY OF THE TEST ARTICLES CN49730A-TASTAB****I. PARTS TO BE CHANGED****A. SECTION VI. REGULATORY STANDARDS**

This section is amended to read as follows:

Good Laboratory Practices (GLP) for Nonclinical Laboratory Studies, U.S. Code of Federal Regulations, 21 CFR Part 58, September 4, 1987 (not for product registration) will be followed for all work performed at Battelle. The stability analyses to be conducted at RJR and Labstat International ULC will not be conducted in accordance to GLP.

**B. SECTION X. RECORDS TO BE MAINTAINED**

This section is amended to read as follows:

All records produced or submitted to Battelle will be maintained under the direction of Battelle in the archives according to SOPs. Records not submitted to Battelle by RJR and Labstat International ULC will be archived by the lab conducting the analysis.

**II. REASON FOR CHANGE**

Clarification of the regulatory standards for the stability analyses and disposition of data not submitted to Battelle. As a clarification this has no adverse impact on the study.

[Smokeless Tobacco Blend and Extract Toxicology Feeding Studies: Test Article Stability 12/5/11 Confidential](#)**Introduction**

A series of 2-week, 1-month, 3-month, and 2-year rodent toxicology feeding studies were conducted. This set of studies was initiated in March 2008. The 2-week studies were conducted at RJRT, Winston-Salem, NC, while the 1-month, 3-month and 2-year studies were conducted at Battelle, Columbus, OH.

The test articles studied were a smokeless tobacco blend and an aqueous extract of that blend. Two large batches of Blend and Extract were prepared for the entire test battery in March 2008 (Blend: 3/1/08; Extract: 3/5/08). Test articles were initially irradiated in the storage containers to control microbial growth. The test articles were stored frozen at target temperatures of -15°C to -30°C for the duration of the toxicology feeding studies (except when used for preparation of rodent diets).

Although freezing preserves test article integrity, a series of chemical and microbial endpoints were evaluated to determine the 1 month initial (2008) test article stability (Appendix 1) and then several were further evaluated yearly until the completion of the test battery in March 2011. Tobacco Blend and Extract analyses (2009-2011) were conducted at RJRT/Lancaster Laboratories (Winston-Salem, NC), LabStat International ULC (Kitchener, Ontario, Canada), or Trilogy Analytical Laboratory (Washington, MO). In addition, the 2S3 Reference moist snuff (NC State University Tobacco Analytical Services Laboratory, Raleigh, NC) was tested initially for most endpoints as well as yearly for chemistry endpoints evaluated at LabStat. The results of the yearly analyses evaluating test article stability under the conditions of storage used in the studies are summarized in this report.

(b) (4)

**Results**

Results of the initial sample characterization in 2008 including the scope of the study are in Appendix 1. P-values for comparison of time point means and linear trend are in Appendix 2. Graphs for all endpoints measured are in Appendix 3. Data are reported on a wet weight basis except for Tobacco Blend measurements at LabStat, which are reported on a dry weight basis.

Table 1 presents means and standard deviations for chemical endpoints measured at RJRT for 2008 through 2011 for the Tobacco Blend and Tobacco Extract, and 2S3 Reference for 2008. If any of the replicate values were reported BLOD or otherwise not reported precisely, "BLOD" "Yes" indicates samples

## Smokeless Tobacco Blend and Extract Toxicology Feeding Studies: Test Article Stability 12/5/11 Confidential

that included such values, and "No" samples that did not. Means and standard deviations that include non-specific values should be considered approximate. "Nd" in Table 1 means "not determined".

Figures 1 and 2 are examples of data for nicotine and arsenic. Nicotine appears stable over time. Arsenic in the Extract appears stable. The Blend seems more subject to laboratory variation, yet, within a narrow interval, not likely biologically significant. Due to this type of variation, a test for linear trend is more appropriate than a means comparison (post-2008 vs. 2008) to identify changes with time.

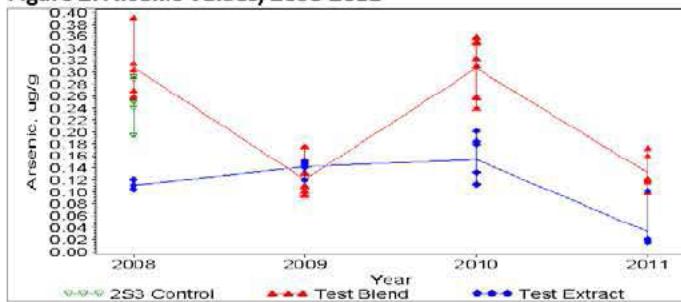

Figure 3 presents replicate values over time for fructose. It shows a clear outlier for the Tobacco Extract in 2010, which is likely due to a method-related error.

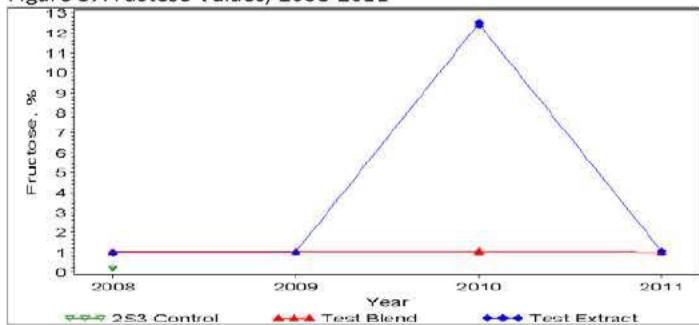

Figure 4 presents replicate values over time for NAB. It shows a drop from 2008 to 2009, after which values appear to be relatively constant. P-values for a linear trend are not significant for either test sample ( $p>0.15$  for both).

Figure 5 presents replicate values for naphthalene. It indicates that values for the test samples are stable over time and below those of the 2S3 Reference moist snuff. This difference is much greater for most of the other PAHs. In fact, means for the 2S3 Reference moist snuff over the entire test period for all end points presented in Table 2 are significantly higher than for the Tobacco Blend (except for acrolein and volatile nitrosamines with many non-specific values which could not be tested); the exception is dry matter (greater moisture for the 2S3 Reference, as expected of moist snuff).

These are indicated with row labels that include M0, M1, and M3. Blanks indicate that no samples were evaluated. Table 3 shows

that non-zero values were observed for total bacteria and water activity, but otherwise non-zero counts were rarely observed.

Figures 6 and 7 present replicate values for total bacteria counts and water activity. Bacteria counts in the Tobacco Extract appear to have dropped in the first three months of 2008, although with the high value observed in 2009 this appears to be normal variation. The test for linear trend was not statistically significant ( $p=0.12$ ). Water activity in Figure 8 shows no linear trend.

## Discussion

This report presents a review of the data from chemical and microbial analyses of periodic samples of a Tobacco Blend and Extract prepared for use in rodent feeding studies. From the start of the study in April 2008 until April of 2011, these materials have been frozen (stored at target temperatures of -15 to -30°C). It would be expected that these materials would be relatively unchanged under these conditions.

Many endpoints showed statistically significant changes compared to means observed in 2008 using analysis of variance. However, levels were frequently quite low, and the measure of variation used in the analysis is based on variation among replicate measures which can underestimate variation and increase test sensitivity. Based on these factors and changes in the means that appear inconsistent with degradation of

[Smokeless Tobacco Blend and Extract Toxicology Feeding Studies: Test Article Stability 12/5/11 Confidential](#)

the sample material, a test of linear trend as a measure of sample degradation was used to determine changes with time.

None of the endpoints tested showed significant changes for Tobacco Blend or Extract with this metric. That is, when the trend analysis was conducted for Tobacco Blend and Tobacco Extract over the analyses years (2008-2011), all p values were greater than 0.05 for all endpoints measured, indicating test article stability with time under the conditions of storage.

Interestingly, a significant linear trend was observed for the 2S3 Reference moist snuff for phenanthrene and benzo(a)anthracene. However, levels of PAHs were much lower in the Tobacco Blend and Extract than in the 2S3 Reference.

The results for NAB shown in Figure 4 suggest that some change may have occurred after 2008, but 1) the test for linear trend was not significant, 2) these are small levels, and 3) there was a major change in the RJRT chemistry laboratories operation (Lancaster Laboratories assumed operations of some of the analytical work) during this time, which could have affected these results as new staff started to execute the respective methods.

### **Conclusion**

Overall, these results indicate that the Tobacco Blend and Extract test articles have been generally stable under the conditions of storage (frozen) over the course of the toxicology test battery, from 2008 to 2011.

## Summary

The chemical and microbiological test article characterization and stability studies were designed to analyze various chemicals of interest and microbiological endpoints to determine the evolution of the test articles over time. Besides the core study plan, there were two additional studies. The first was to obtain 1-month stability data on a subset of key compounds (e.g., nicotine). The second was to obtain additional data on the Blend. Because the Blend had to be ground finer to obtain homogenous diet mixtures for the animal studies, an additional analysis (measuring the same compounds of toxicological interest as for the original test articles) was conducted to demonstrate that the ground and non-ground blends were chemically equivalent.

The initial characterization of the test articles in terms of chemicals of interest indicated that, with some exceptions, the trend was Extract < Blend (for most analytes). The pesticide analyses indicated that, except for 2 pesticides, all tested pesticides were below the limit of quantification. Microbial analyses indicated that microbes were appropriately controlled with the irradiation method and the storage conditions used. Ochratoxin was the only mycotoxin detected.

The 1-month stability study indicated that the test articles were stable under the storage conditions relevant to the toxicology studies. The Blend chemistry data collected indicated that the Blends (ground and non-ground) were substantially equivalent from a chemical standpoint based on the analytes measured.

Taking all data into account, results to date 1) indicate that the test articles were appropriately controlled (stable under the conditions of storage) and 2) support the test articles use in the smokeless Tobacco Blend and Extract rodent feeding toxicology studies.

## Test article characterization

### Test design

Analyses were planned for 2008, 2009, 2010, and 2011 to span the full length of the toxicology studies and to determine the evolution of the measured endpoints for the test articles with time.

The test article characterization study had 2 main components:

- 1) Chemical analyses conducted at
  - a. RJRT
  - b. Labstat

## Smokeless Tobacco Blend and Extract Toxicology Feeding Studies: Test Article Stability 12/5/11 Confidential

The chemical and microbiological test article characterization and stability studies were designed to analyze various chemicals of interest and microbiological endpoints to determine the evolution of the test articles over time. The chemistry endpoints that were planned to be measured are presented in Table 1.

For microbiological measurements, periodic samples were planned to be analyzed monthly, initially, then yearly, thereafter.

Besides the chemistry and microbiology core study plan, there were two additional studies. The first was to obtain 1-month stability data on a subset of key compounds (e.g., nicotine). The second was to obtain additional data on the Blend. Because the Blend had to be ground finer to obtain homogenous diet mixtures for the animal studies, an additional analysis (measuring the same compounds of toxicological interest as for the original test articles) was conducted to demonstrate that the ground and non-ground Blends were chemically equivalent.

Where appropriate, an additional reference smokeless tobacco (2S3, moist snuff) was included. The inclusion of this reference tobacco was designed mainly to help ensure that the methods used were working as expected.

### Initial test article characterization

#### Results summary: March-July 2008

##### 1) Chemistry results

###### a) RJRT analyses

###### Full production test article characterization (initial time point)

The test articles were produced for toxicology testing in March 2008. Analyses were conducted on these samples between March and July 2008. The storage conditions were initially room temperature for the Blend and <0°C for the Extract. Subsequently, the Blend was stored at <4°C in cold storage and the Extract continued to be stored frozen (<0°C). The test articles were transported to the contract toxicology laboratory under frozen conditions ( $\leq -10^{\circ}\text{C}$ ) and they were to be subsequently stored frozen at the contract laboratory ( $<-15^{\circ}\text{C}$ ).

For the initial test article characterization (full production batch, GN75387), the set of analytes measured at RJRT indicated that the trend was E  $\leq$  B (Table 3), except for glucose and catechol, where E > B. The trend was not as consistent for the B or E vs. reference (2S3, R) comparisons. For the available values, the analyte concentrations measured for the 2S3 reference indicated that the methods worked as expected.

P-values comparing all three samples were adjusted to control for multiple comparisons using the Bonferroni method, with  $p < 0.05$  required for statistical significance. Small differences are significant in some cases because of small variation among replicates.

**b) Labstat analyses**

The results for the analytes measured in the test articles and 2S3 reference (R) of the initial test article characterization work (2008 analysis) are presented in Table 4. The general trend for measured analytes is as follows: E < B < R. It is noteworthy that many PAHs are present at much lower levels in the Blend and Extract than in the reference tobacco.

### c) Microbac analyses

The following pesticides were measured (GN75387AB-Blend, AC-Extract): alachlor, aldrin, benfluralin, bifenthrin, butralin, camphechlor, captan, chinomethionate, chlordane, chlorothalonil, cyfluthrin, λ-cyhalothrin, cypermethrin, o,p-DDD, p,p-DDD, o,p-DDE, o,p-DDT, p,p-DDT, deltametrin, dichloran, dieldrin, dinocap, endosulfan I, endosulfan II, endosulfan SO4, endrin, esfenvalerate, fenvalerate, flucytrinate, flumetralin, folpet, α-HCH, β-HCH, δ-HCH, heptachlor, heptachlor epoxide, hexachlorobenzene, isopropalin, lindane (γ-HCH), methoxychlor, nitrofen, pendimethalin, permethrin, pyrethrins, trifluoralin, EBDC (as mancozeb), maleic hydrazide, acephate, ethyl azinphos, methyl azinphos, methyl bromophos, chlorgenvinphos, chlorpyrifos, S-methyl demeton, diazinon, dichlorvos, dimefox, dimethoate, disulfoton, disulfoton sulfone, disulfoton sulfoxide, ethoprophos, fenamiphos, fenamiphos sulfoxide, fenamiphos sulfone, fenchlorphos, fenitrothion, fensulfothion, fenthion, fenthion sulfone, fenthion sulfoxide, fenophos, formothion, malathion, methamidophos, methidathion, mevinphos, monocrotophos, naled, parathion, methyl parathion, phorate, phosalone, phosphamidon,

*'Smokeless Tobacco Blend and Extract Toxicology Feeding Studies: Test Article Stability 12/5/11 Confidential'*

phoxim, methyl pirimiphos, profenofos, trebufos, trebufos sulfone, trebufos sulfoxide, tetrachlorvinphos, thionazin, trichlorfon, vamidothion, vamidothion sulfoxide, dicamba, 2,4-D, 2,4,5-T, aldicarb, aldicarb sulfone, aldicarb sulfoxide, benalaxyl, butylate, carbaryl, carbofuran, clomazone, diflubenzuron, dimethomorph, diphenamid, ethiofencarb, ethiofencarb sulfone, ethiofenacarb sulfoxide, 3-hydroxycarbofuran, metalaxyl, methiocarb, methiocarb sulfone, methiocarb sulfoxide, methomyl, 1-naphtol, oxadixyl, oxamyl, pebulate, piperonyl butoxide, pirimicarb, and propoxur.

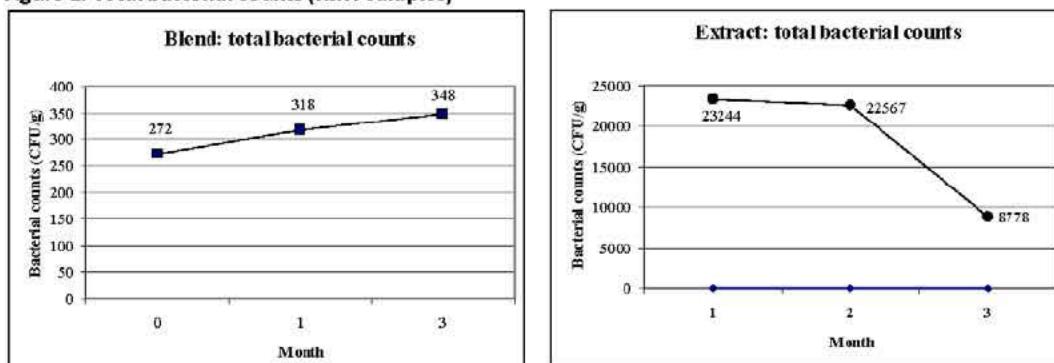

With the exception of metalaxyl and butralin, all measured pesticides were below the limit of quantitation. However, based on mouse and rat-specific toxicology data and exposure assessments, the presence of these two pesticides at such low levels in the tobacco test articles is not expected to contribute in any substantial way to subchronic/chronic toxicity in rats and mice in the feeding studies. Therefore, these analytes were only included in the initial test article characterization.

## 2) Microbiology results

### a) RJRT microbial analyses

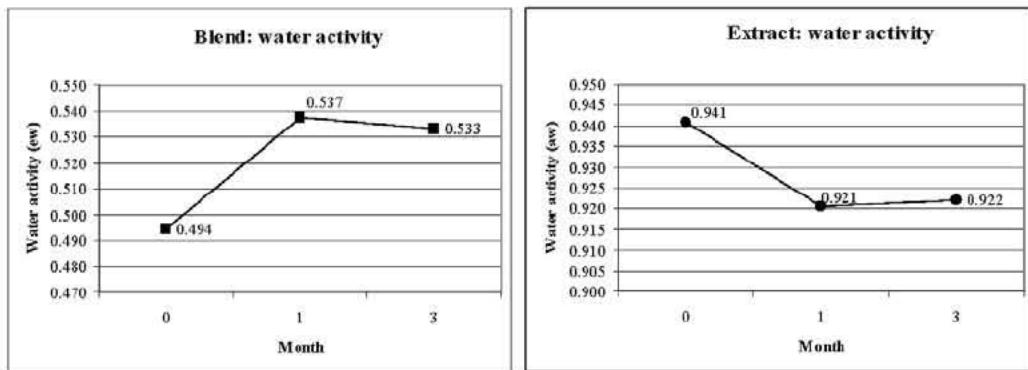

Figures 1 and 2 indicate the progress of the irradiated test articles with time in terms of microbial endpoints (for the initial samples stored under RJRT conditions at -7°C). Except for total bacterial counts and water activity (which showed changes from the beginning of the study to month 3), there were no other targeted organisms detected at month 3. By month 3, total bacterial counts were slightly increased for the Blend and decreased for the extract. However, the water activity for the Blend was still below the level where significant growth would be expected, and, although there was a slight increase in the total bacterial counts for the Blend, the average values are still within acceptable limits.

**Figure 1. Total bacterial counts (RJRT samples)**

Smokeless Tobacco Blend and Extract Toxicology Feeding Studies: Test Article Stability 12/5/11 Confidential

**Figure 2. Water activity (RJRT samples)**

#### b) Trilogy mycotoxin analyses

Test articles were tested in April-May 2008 to determine the presence of mycotoxins. No mycotoxins were detected in the Blend or extract except for Ochratoxin A. The presence of Ochratoxin A was confirmed by repeating the analysis. However, based on mouse and rat-specific toxicology data and exposure assessments, the presence of Ochratoxin A at such low levels would not be expected to induce Ochratoxin-specific toxicity in the rat and mouse feeding studies.

### 3) Additional analyses

#### a) 1-Month stability study: March vs. April 2008 analysis (effects of storage conditions on chemistry endpoints)

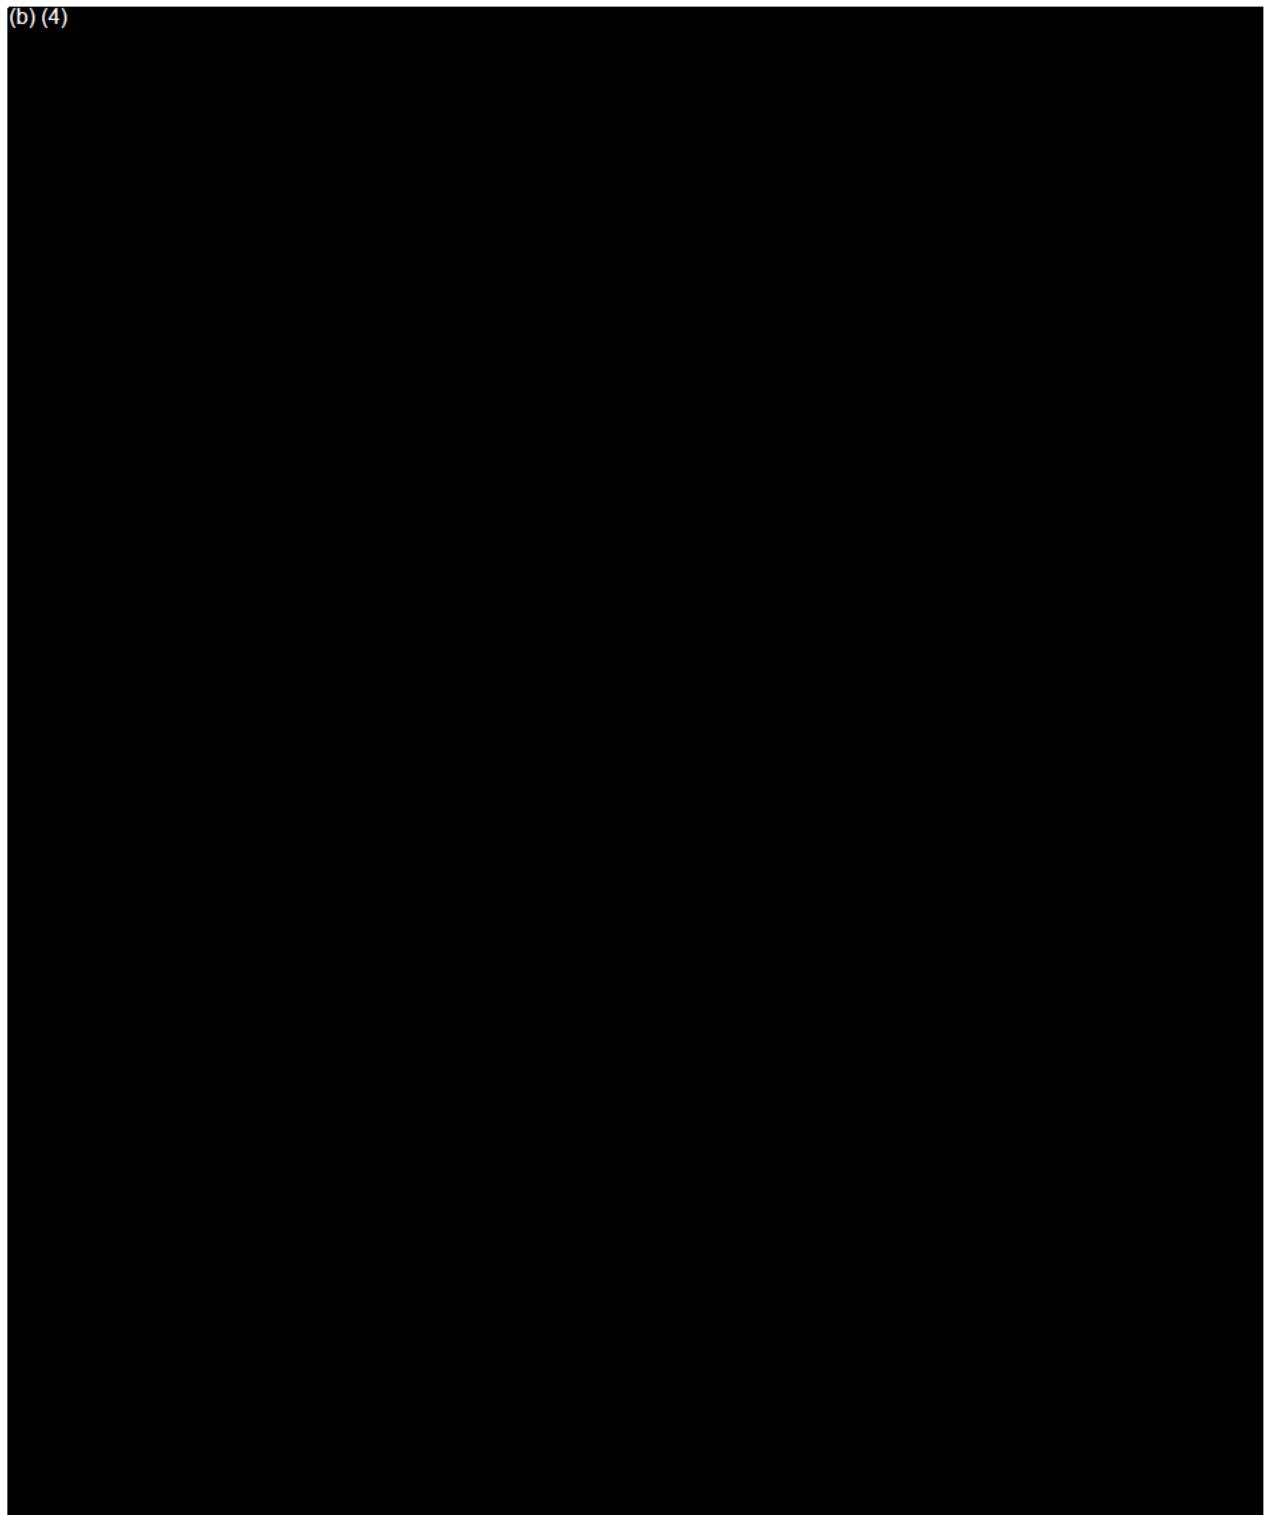

A 1-month stability study was conducted using an abbreviated list of compounds to obtain a preliminary read on the stability of key analytes under applicable storage conditions (GN76582). Results from this analysis are presented in Table 5.

## I. INTRODUCTION

The purpose of this study was to validate the analysis method, determine the homogeneity of various feed formulations, and assess their stability using nicotine as the target analyte.

This report contains:

- A description of method used to analyze nicotine in various formulations made in NTP-2000 feed.
- The results of the method validation.
- The results of a formulation homogeneity study.
- The results of stability studies.
- Conclusions.

This work was performed at Battelle, 505 King Avenue, Columbus, OH 43201.

## II. TEST ARTICLE

Tobacco blend, Lot No. OT162AF, was received from R.J. Reynolds (RJR), Inc. It was used to prepare all tobacco blend formulations in this report. The tobacco blend has 26.28 mg/g of nicotine per the certificate of analysis.

Tobacco extract, Lot No. OT162AE, was received from R.J. Reynolds (RJR), Inc. It was used to prepare all tobacco extract formulations in this report. The aqueous tobacco extract has 22.99 mg/g of nicotine per the certificate of analysis.

## III. POSITIVE CONTROL

Nicotine hydrogen tartrate, Lot No. 028K0705 received from Sigma-Aldrich, Inc. It was used to prepare all nicotine hydrogen tartrate formulations in this report. Nicotine free base comprises 35.1% of this salt. The free base concentration was used to express all formulation concentrations.

## IV. ANALYTICAL STANDARD AND INTERNAL STANDARD (IS)

Nicotine hydrogen tartrate, Lot No. 028K0705 received from Sigma-Aldrich, Inc. It was used to perform all work covered in this report.

Quinoline, Lot No. 097K2601 received from Sigma-Aldrich, Inc. It was used as the IS for all work covered in this report.

## V. FORMULATION ANALYSIS METHOD VALIDATION

This section describes the validation of the method to analyze nicotine formulations in NTP-2000 feed.

#### VI. FORMULATION HOMOGENEITY

Homogeneity was assessed for multiple formulations of the three test articles prepared in NTP-2000 feed. The formulations are shown in Table 13. Triplicate samples were taken from the top left, top right, and bottom of each formulation for homogeneity analysis.

**Table 13 – Feed Formulations Assessed for Homogeneity**

1. Nicotine hydrogen tartrate is 35% nicotine to calculate the nicotine concentration.\*
  2. The tobacco blend has 26.28 mg/g of nicotine. To calculate the nicotine concentration, 38.05 mg of tobacco blend is needed for every mg of nicotine.\*
  3. The aqueous tobacco extract has 22.99 mg/g of nicotine. To calculate the nicotine concentration, 43.50 mg of tobacco extract is needed for every mg of nicotine.\*
  4. mg of nicotine per kg of feed.
- \* Calculation was performed by spreadsheet which used food consumption, body weights, and desired dose of mg/kg/day to calculate the exact target nicotine concentration.

The homogeneity analysis was performed using the validated method, except that only one standard curve was used, no QC's were analyzed, and triplicate blanks and blanks with IS were analyzed.

#### A. ANALYSIS

For each formulation, triplicate  $10 \pm 1$  g aliquots were taken from each sample location (top left, top right, and bottom). Each aliquot was weighed into individual 120-mL amber glass bottles.

Twenty-five (25) mL of aqueous 2N sodium hydroxide was added to each sample. The bottles were capped and contents mixed well to wet all the feed. The samples were allowed to stand for approximately 15 minutes.

Fifteen (15) mL of extraction solution was then added to each sample. They were then placed on a wrist action shaker for approximately two hours. During the two hours of shaking, the shaker was occasionally stopped and the samples were removed individually and shaken by hand to make sure there was no feed sticking to the upper side of the bottle. The samples were then placed back on the shaker to resume the shaking.

The samples were centrifuged for approximately 15 minutes at a setting of 2000 rpm.

The samples that needed dilution into the standard curve were diluted with blank feed extracted extraction solution.

An appropriate amount of the extract solution (supernatant) was then transferred to a GC vial and the vial was sealed.

The results from analysis of each formulation prepared in NTP-2000 feed are in Table 14 through Table 23.

\* Samples were a repeat analysis of the bottom location, due to the fact that the first B and C samples were low. The reason for this was believed to be clumping of these samples during extraction which prevented complete extraction recovery.

## B. CONCLUSIONS

The grand average determined concentrations were within 10% of target for the nicotine hydrogen tartrate and tobacco extract formulations. The grand average RSDs were less than the acceptance value of 10% for all nicotine hydrogen tartrate and tobacco extract formulations. The grand average REs were between 4.0 and 21.1% of target concentration for the tobacco blend formulations based on nicotine concentration values provided by RJR. Through additional analyses during the 90-day animal studies (CN49730E and CN49730F), it was discovered that tobacco

blend nicotine concentration tends to be higher than the 26.28 mg/g concentration of nicotine, which was provided by the Sponsor and is variable between buckets of blend. The grand average RSDs for the tobacco blend were less than the acceptance value of 10% for all formulations, showing that the formulation was homogenous among all locations. Therefore, the formulation method was acceptable for producing homogenous formulations at all formulation concentrations and types.

## VII. FORMULATION STABILITY STUDY

Stability of the nicotine formulations was first conducted using samples from the homogeneity study. These samples were stored in plastic bags in a room temperature cabinet. It was discovered during the 7 to 11, 14 to 18, 26 to 40, and 65 to 85 day time point analyses that the nicotine in the higher formulations was apparently evaporating out of high concentration bags through the plastic and being absorbed into the bags of the lower concentration formulations. This was shown in the tobacco blend and tobacco extract low formulations (3 mg/kg of nicotine) where the Day 0 analyses were within 10% of the target and by the day 65 to 85 analyses the average concentrations were greater than 45% above target.

Stability was then conducted on all formulations that were the first batches prepared for both 90-day rat and mouse studies (CN49730E and CN49730F).

These formulation storage stability studies were conducted on formulations stored at room temperature for approximately 82 to 92 days in plastic bags inside plastic buckets. These samples came from feed that was not needed to feed animals from the first batches of formulations for studies CN49730E and CN49730F. These buckets had been previously opened and used to fill feeder jars for the toxicology study. The samples were treated identically to typical study samples because they were taken from actual study buckets.

The stability analysis was performed using the validated method with the exception that only a single feed standard curve was prepared, a reduced number of blanks were used, and QCs were not prepared.

### A. STUDY DESIGN

Formulations of nicotine hydrogen tartrate, tobacco blend, and tobacco extract in NTP-2000 feed were stored at room temperature. Each formulation was in plastic bags inside a plastic bucket. Triplicate aliquots were analyzed after storage for 82 to 92 days for nicotine concentration. These formulations had been previously analyzed before they were used to feed animals during their respective studies and had been approved for use by the client.

### B. RESULTS

All the feed formulations were within 10% of the concentration determined (except for the 1370 mg/kg tobacco blend formulation which was 11.9% high, but was released by the client for use) after the formulations were prepared. The stability results are shown in Table 24 through Table 29.

### C. CONCLUSIONS

The recommended storage temperature for all formulations prepared is room temperature for up to 82 days. Feed formulations were between -5.6 to -15.3% of the initially determined nicotine concentration for nicotine hydrogen tartrate formulations for 92 days of storage. Feed formulations were within 10% of the initially determined nicotine concentration for tobacco blend formulations, except for two of the formulations (18264 and 27397 mg/kg) which were -10.1 and -10.8% below the initially determined concentration, after 82 to 92 days of storage. Feed formulations were within 10% of the initially determined nicotine concentration for tobacco extract formulations, except for one of the formulations (2088 mg/kg) which was -10.7% below the initially determined concentration after 92 days of storage.

### VIII. STUDY RECORDS

All the study records and final report will be stored in Battelle's archives.

**I. PURPOSE**

The purpose of this study will be to:

- Transfer and validate the analytical methodology for the determination of nicotine in formulated rodent diet.
- Demonstrate that the planned formulation method produces homogenous formulations at the batch size and concentrations planned for the 28-day studies.
- Determine stability of the formulations prepared at the concentrations planned for use in the 28-day studies.

Good Laboratory Practices (GLP) for Nonclinical Laboratory Studies, U.S. Code of Federal Regulations, 21 CFR Part 58, September 4, 1987. (not for product registration)

**VII. TEST ARTICLES, POSITIVE CONTROL, DIET AND ANALYTICAL STANDARD**

The test articles for this study will be tobacco blend and aqueous tobacco extract.

The positive control for this study will be nicotine hydrogen tartrate.

The nicotine hydrogen tartrate will be used as the analytical standard. The nicotine free base is 35.1% of the salt and the free base. The free base concentration will be used for both standard concentrations and formulation concentrations.

The diet used for this study will be NTP-2000 meal feed.

**VIII. PREPARATION OF DIETS**

Formulations will be prepared according to a documentation form that is approved by the study director. Formulations will be prepared at the following concentrations

**Formulations to be Prepared for this Study**

Test Article	Test Article Concentration (mg/kg)	Blend Size (kg)	Equivalent Nicotine Dose (mg/kg of body weight/day)
Nicotine Hydrogen Tartrate	1026	25	20
	8550	12	400
Tobacco Blend	13698	25	20
	114	25	0.2

Aqueous Tobacco Extract	15659	25	20
	130	25	0.2
	152240	12	400
	13049	12	20

Single samples (approximately 200 g each) from the top left, top right and bottom of the blender will be taken from all prepared formulations for homogeneity determination (triplicates of each sample will be analyzed for homogeneity). The single samples will be sampled and analyzed in triplicate.

Twenty samples (approximately 100 g each) will be taken from the middle of each formulation to be used for the stability study. One stability sample will be analyzed in triplicate on the day of preparation and the remainder will be stored at room temperature until analyzed.

**X. STORAGE STABILITY****A. METHOD**

Will use the method validated in part IX.

**B. DAY OF PREPARATION**

Triplicate aliquots of each prepared formulation will be analyzed on the day of preparation (day 0).

**1. Acceptance Criterion**

The average determined concentration from this analysis will be considered the Day 0 concentration, if it is within 10% of the target concentration.

**C. STABILITY TIME POINTS**

Samples of each prepared formulation will be stored at room temperature and analyzed on days 7 to 9, 14 to 16, 28 to 34, and 63 to 70 after preparation. At each stability time point, triplicate aliquots of each sample will be analyzed.

**1. Acceptance Criterion:**

- Formulations will be considered stable if the average determined concentration is within 10% of the initially determined concentration of the formulation.

**XI. HOMOGENEITY****A. METHOD**

Will use the method validated in part IX.

**B. DESIGN**

Triplicate aliquots from samples from the top right, top left and bottom will be analyzed.

**C. ACCEPTANCE CRITERIA**

Average total relative error (average of the three locations) less than 10% of nominal. Total relative standard deviation (of the three locations) less than 10%.

**XII. DATA SYSTEM**

Atlas version 8.2 (Thermo Fisher Scientific, Waltham, MA) – chromatography data system

**XIII. RECORDS TO BE MAINTAINED**

All records required to reconstruct the study and the analytical validation report will be maintained under the direction of Battelle in the archives according to SOPs.

**XIV. STATISTICAL METHODS**

Simple statistical endpoints that may be calculated include standard deviation, percent relative standard deviation (RSD), and percent relative error (RE). When possible, relevant graphs to aid interpretation of data will be included in the final report.

**AMENDMENT/DEVIATION 1 FOR THE STUDY DESIGN FORM FOR STABILITY  
AND HOMOGENEITY OF TEST ARTICLES AND POSITIVE CONTROL  
FORMULATIONS AND METHOD VALIDATION FOR DETERMINATION OF  
NICOTINE IN FORMULATED RODENT DIET**

**I. PARTS TO BE CHANGED BY AMENDMENT**

**A. SECTION VIII. PREPARATION OF DIETS**

This table is amended to read as follows:

**Formulations to be Prepared for this Study**

Test/Control Article	Test/Control Article Concentration (mg/kg)	Blend Size (kg)	Equivalent Nicotine Dose (mg/kg of body weight/day)
Nicotine Hydrogen Tartrate	1026	25	20
	4988	12	200
Tobacco Blend	13698	25	20
	114	25	0.2
	66589	12	200
	571	12	2
	15659	25	20
Aqueous Tobacco Extract	130	25	0.2
	76120	12	200
	652	12	2

**B. REASON FOR CHANGE**

Added "control" to the first two column headers for clarification. Dose levels for the mouse were changed for all three test/control articles.

**II. DEVIATION/AMENDMENT**

**A. SECTION X.C. STABILITY TIME POINTS**

This section initially read as follows:

"Samples of each prepared formulation will be stored at room temperature and analyzed on days 7 to 9, 14 to 16, 28 to 34, and 63 to 70 after preparation. At each stability time point, triplicate aliquots of each sample will be analyzed."

In order to accommodate the fact that formulations had to be prepared over multiple days and that the analysis would take multiple days this section had to be deviated from and is being modified to address both the deviation (already completed work) and the amendment (planned work) as follows.

Samples of each prepared formulation will be stored at room temperature and analyzed on days 7 to 11, 14 to 18, 26 to 40, and 65 to 85 after preparation. At each stability time point, triplicate aliquots of each sample will be analyzed.

This modification (amendment/deviation) has no adverse impact on the study.

**AMENDMENT 2 FOR THE STUDY DESIGN FORM FOR STABILITY AND  
HOMOGENEITY OF TEST ARTICLES AND POSITIVE CONTROL  
FORMULATIONS AND METHOD VALIDATION FOR DETERMINATION OF  
NICOTINE IN FORMULATED RODENT DIET**

**I. DEVIATION /AMENDMENT**

**A. SECTION XI.C ACCEPTANCE CRITERIA FOR HOMOGENEITY**

The grand average %RE acceptance criteria of the homogeneity for the tobacco blend formulations were greater than 10%. The grand average %RE for the tobacco blend formulations ranged from 4.0 to 21.1%. The grand RSDs for these formulations were between 1.2 and 6.9%. This demonstrates that the formulation is homogeneous, but the desired concentration is above target. Analyses during 90 day animal studies (CN49730E and CN49730F), indicated that tobacco blend nicotine concentration was above target by an average of approximately 8-10%.

**II. DEVIATION /AMENDMENT**

**A. SECTION X.C. STABILITY TIME POINTS AND ACCEPTANCE CRITERION**

Initial stability analysis indicated that formulations at lower concentrations were increasing over time.

The stability samples were being stored differently than the study samples because the stability samples were stored inside separate plastic bags that were in a closed cabinet at room temperature. The actual study samples were stored inside plastic bags that were inside separate plastic buckets and stored at room temperature.

The investigation indicated that the nicotine was transferring through the plastic bags.

The stability study was repeated by using actual study samples (CN49730E and CN49730F) that were unused from the study and were the first batches prepared for those studies. These samples were left in their plastic bags that were in their individual plastic buckets and stored at room temperature and analyzed after 79 to 90 days of their preparation date. All batches from the first preparations for both studies were analyzed to show the formulations were stable under the exact conditions they were stored during the study.

This modification (amendment/deviation) has no adverse impact on the study.

**Battelle Toxicology Columbus**

**Study Title:** The Handling and Stability of the Test Articles (CN49730A-TASTAB)

**Type of Deviation:** Design Form

**Deviation Date:** December 29, 2008

**Incident:** Location: Freezer, X-49933

The temperature was recorded as -9°C at 3:35:06 p.m. and did not return to the normal operating range (-30°C to -15°C) until 4:35:07 p.m. This is in violation of design form section VII, which states that test articles and samples from these test articles will be stored at approximately -20°C.

**Cause of Incident:** Staff pulling items out of unit.

**Impact on Study:** No impact.

**Corrective Action:** None.

## 1.0 INTRODUCTION

This report contains formulation analysis results. The method used to produce these results was validated under CN49730A-FORMPRE. A version of the standard operating procedure (SOP) used to analyze the samples is appended to this report (Appendix A). Samples were received for analysis as shown in the table below.

a. Homogeneity samples.

## 2.0 RESULTS

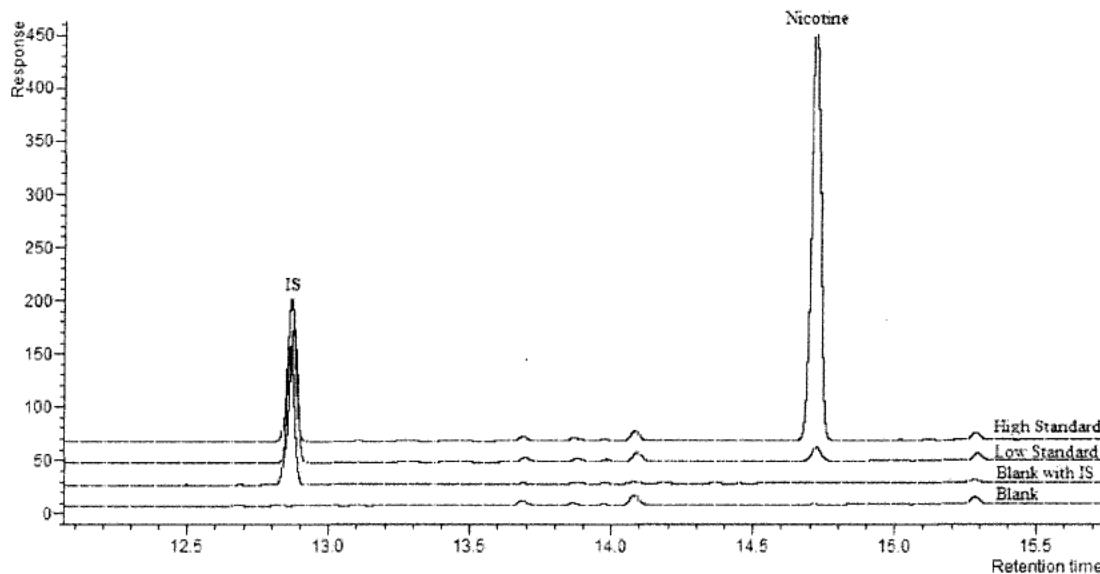

Pre-dose formulations of control, tobacco blend, and tobacco extract doses are shown in Tables 1 through 8, and 12 to 52. Homogeneity assessments of high and low dose formulations for tobacco blend and tobacco extract are shown in Tables 4, 5, 16, and 17. Post-dose (animal room) formulations are shown in Tables 9 through 11. All acceptance criteria (within 10% of target concentrations; relative standard deviation [RSD] less than or equal to 10%) were met except for the following.

- For the analysis on February 18, 2009 – Standard 3 was dropped from the standard curve for not meeting acceptance criteria for relative error (%RE).
- For the analysis on February 18, 2009 – The low dose formulations were too low to bracket with the existing standard curve so a lower standard (target concentration of 1.45 mg/kg) was added to the standard curve. Six additional replicates of this standard were also added to simulate a partial validation for this low standard. The six replicates results are shown in Table 2.

**Table 2. Additional Lower Standard**

Nominal Nicotine Concentration (mg/kg)	Determined Concentration (mg/kg)	Average Determined Concentration (mg/kg) $\pm$ s	%RSD	%RE	Average %RE

Representative overlaid chromatograms from nicotine high and low concentration standards, a blank with IS, and a blank are shown in Figure 1.

**Figure 1. Representative Overlaid Chromatograms from Nicotine High and Low Standards, a Blank with IS, and a Blank**

- In the February 18, 2009 analysis, 5-BLEND-7 had an average RE of 10.4 percent, and 5-BLEND-3 had an relative standard deviation (RSD) of 14.9 percent. The formulations were approved for use.
- In the March 18, 2009 analysis, 6-EXTRACT-7 had an average RE of 13.2 percent. The formulation was approved for use.

- In the March 18, 2009 analysis, 6-BLEND-1 had an RSD of 17.1 percent. The formulation was discarded and a new formulation was prepared.
- In the March 24, 2009 analysis, 6A-BLEND-1 had an RSD of 12.6 percent. The formulation was approved for use.
- In the April 6, 2009 animal room sample analysis, 5-BLEND-3 had an average RE of 10.3 percent, and 5-EXTRACT-1 had an average RE of 23.4 percent. There are no acceptance criterion for post-administration samples.
- In the April 13, 2009 analysis, 7-BLEND-1 had an average RE of 15.4 percent. The formulation was approved for use.
- In the May 18, 2009 analysis, 8-BLEND-3 had an average RE of 19.7 percent, and an RSD of 11.0 percent. The formulation was discarded and a new formulation was prepared.
- In the May 18, 2009 analysis, 8-BLEND-2 had an RSD of 10.7 percent, and 8-BLEND-4 had an average RE of 13.6 percent, and an RSD of 14.8%. The formulations were approved for use.
- In the May 28, 2009 analysis, 8A-BLEND-3 had an average RE of 17.5 percent. The formulation was approved for use.
- In the July 8, 2009 analysis, nicotine hydrogen tartrate, Lot 028K0705, was used as an analytical standard but had expired 5/20/09. A lot comparison was performed on this lot and 098K0676 on 7/17/09 and indicated that Lot 028K0705 had a relative purity of 99.6 percent.
- In the July 8, 2009 analysis, 9-BLEND-1 had an average RE of 29.4 percent. 9-BLEND-2 had an average RE of 20.5 percent and an RSD of 23.3%, 9-BLEND-3 had an average RE of 19.6 percent, and 9-BLEND-8 had an average RE of 16.5 percent. The formulations were discarded and new formulations were prepared.
- In the July 8, 2009 analysis, 9-BLEND-6 had an average RE of 15.8 percent and 9-BLEND-7 had an average RE of 13.1 percent. 9-BLEND-12 had an average RE of 11.3 percent. The formulations were approved for use.
- In the July 16, 2009 analysis, 9A-BLEND-1 had an average RE of 16.6 percent and an RSD of 10.4 percent. The formulation was approved for use.
- In the July 8, 2009 analysis, 9-EXTRACT-1 had an average RE of 12.5 percent, 9-EXTRACT-2 had an average RE of 11.1 percent, and 9-EXTRACT-3 had an average RE of 16.0 percent. The formulations were approved for use.

- In the August 3, 2009 analysis, 9B-BLEND-1 had an average RE of 24.0 percent. The formulation was discarded.
- In the August 13, 2009 analysis, 9C-BLEND-1 had an average RE of 20.1 percent and an RSD of 21.3 percent. The formulation was approved for use.
- In the September 9, 2009 analysis, 10-BLEND-1 had an RSD of 10.7 percent, 10-BLEND-2 had an RSD of 10.4 percent, and 10-BLEND-12 had an average RE of 10.4 percent. The formulations were approved for use.
- In the September 9, 2009 analysis, 10-EXTRACT-4 had an average RE of 16.8 percent. The formulation was discarded and a new formulation was prepared.
- In the October 29, 2009 analysis, 11-BLEND-3 had an average RE of 12.3 percent and an RSD of 15.3 percent. The formulation was approved for use.
- In the November 4, 2009 analysis, 11-EXTRACT-2 had an average RE of -12.7 percent. The formulation was approved for use.
- In the December 23, 2009 analysis, 12-BLEND-2 had an RSD of 14.1 percent, 12-BLEND-3 had an RSD of 12.1 percent, 12-BLEND-6 had an average RE of 11.5 percent, and 12-BLEND-7 had an average RE of 10.6 percent. The formulations were approved for use.
- In the February 18, 2010 analysis, the system suitabilities did not meet acceptance criteria for efficiency. There was no adverse impact on the data. All other parameters for the system suitabilities were acceptable, and the chromatography was similar to other runs that were acceptable.
- In the February 18, 2010 analysis, 13-BLEND-1 had an RSD of 12.2 percent and 13-BLEND-2 had an RSD of 11.2 percent. The formulations were approved for use.
- In the April 15, 2010 analysis, 15-BLEND-2 had an RSD of 12.3 percent, 15-BLEND-3 had an RSD of 10.2 percent, 15-BLEND-4 had an average RE of 10.4 percent, and 15-BLEND-7 had an average RE of 15.6 percent. The formulations were approved for use.
- In the June 10, 2010 analysis, 16-BLEND-1 had an RSD of 14.7 percent, 16-BLEND-2 had an RSD of 16.6 percent, 16-BLEND-3 had an average RE of 14.0 percent and an RSD of 10.1 percent, and 16-BLEND-4 had an average RE of 11.0 percent and an RSD of 13.8 percent. The formulations were approved for use.

- In the August 5, 2010 analysis, 17-BLEND-1 had an RSD of 13.4 percent and 17-BLEND-8 had an average RE of 16.2 percent. The formulations were approved for use.
- In the September 28, 2010 analysis, 18-BLEND-2 had an average RE of 13.9 percent, 18-BLEND-3 had an average RE of 15.1 percent, and 18-BLEND-4 had an RSD of 13.0 percent. The formulations were approved for use.
- In the November 24, 2010 analysis, 19-BLEND-1 had an average RE of 10.5 percent, 19-BLEND-2 had an average RE of 12.3 percent, 19-BLEND-4 had an average RE of 12.2 percent and an RSD of 13.9 percent, 19-BLEND-8 had an average RE of 10.2 percent, 19-EXTRACT-2 had an average RE of 14.5 percent and an RSD of 15.6 percent, 19-EXTRACT-4 had an RSD of 15.4 percent, 19-EXTRACT-5 had an RSD of 11.9 percent, and 19-EXTRACT-10 had an RSD of 10.8 percent. The formulations were approved for use.
- In the January 20, 2011 analysis, two of the system suitability injections did not meet acceptance criteria for efficiency, and another two did not meet criteria for asymmetry. There was no adverse impact on the data. All other parameters for the system suitabilities were acceptable. The peak shapes were similar to the other three injections and the chromatography was consistent throughout the entire run. The system suitability RSD was 1.5 percent showing the consistency between injections.
- In the January 20, 2011 analysis, 20-BLEND-2 had an RSD of 14.0 percent, 20-EXTRACT-2 had an RSD of 14.1 percent, 20-EXTRACT-7 had an RSD of 14.0 percent, and 20-EXTRACT-8 had an RSD of 15.9 percent. The formulations were approved for use.

Note: Derived values displayed in this report may have been calculated using truncated (not rounded) values. Calculations performed using truncated values may vary in the last displayed figure from those calculated using the displayed value since the actual calculation may have been made using a value containing more digits than are displayed.

### 3.0 AMENDMENTS/DEVIATIONS

#### 3.1 Amendments

There were no amendments pertaining to the formulation analysis of nicotine for this study.

#### 3.2 Deviations

The formulation sample analysis raw data contained several minor SOP deviations that were assessed as no impact by the Study Director.

Make equivalent dilutions when the volume needed varies from the volume stated in the method.

Label all standard and reagent solutions as specified in the appropriate SOP.

Sign or initial on each page of this document to signify that you have followed the method as written, all materials and reagents are current, and all equipment has been properly calibrated.

Initial and date all data entries on the page on which they were made. If only one person enters all data on a page on a single day, then the documentation may be made in a single location on that page by that person. If multiple staff make entries or one person makes entries on different days, all must be initialed and dated by the person making the entry.

The method is written in general chronological order. However, it is not essential that all sections be performed sequentially. The analyst may determine the order for conducting the task in the most efficient manner, unless the order for certain activities is specified.

## 7.0 CALCULATIONS

Examine the integration of the peaks. Modify, as necessary, to obtain consistent integration. Ensure that the response of the standards bracket the response for all formulation samples.

Calculate the exact concentration of each standard and enter these into the chromatography data system.

Use the parameters in Table 12 to calculate the regression equation.

**Table 12. Regression Parameters**

Model	Linear
Weighting	1/x
y-intercept	Calculate, Do Not Force through Origin
y-values	Nicotine/IS Peak Area Ratio
x-values	Nicotine Standard Concentrations

Calculate the % Relative Error (RE) for each standard. If the RE of any standard is not within 10% of the nominal concentration, evaluate the impact of omitting that calibration standard from the curve. One standard may be omitted from the curve, if deemed technically necessary.

Calculate the chromatography acceptance criteria parameters specified in Table 13 for the system suitabilities.

Calculate the concentration, the average concentration, the standard deviation (s), and the percent relative standard deviation (RSD) for the system suitabilities.

Calculate the concentration for each "drift" and compare it to the average of the system suitabilities.

Calculate the amount of nicotine in each formulation sample using its peak ratio response, the regression equation, and dilution factor.

Calculate the average concentration, individual and average RE, s, and RSD for the triplicates. Examine any potential outliers using the Q-test with a 90% confidence interval.

The concentration units in Atlas are mg/kg.

## 8.0 RESULTS

Place the spreadsheet in the data package. Report all values with concentrations below the specified limit of quantitation as "BLOQ." The Limit of Quantitation (LOQ) is 2.11 mg/kg.

Produce the Atlas Report "Run Reference" and include it the data package.

Include the chain of custody forms in the data package.

#### 9.0 ACCEPTANCE CRITERIA

See Table 13 for acceptance criteria.

**Table 13. Acceptance Criteria**

(b) (4)

#### 10.0 TASK LEADER RESPONSE TO FAILURE TO MEET ACCEPTANCE CRITERIA

##### 10.1 Asymmetry, Efficiency, Resolution

Verify that the proper instrument system (column, gas, flow rates, etc.) was used for the analysis. If not, samples need to be re-injected using the correct instrument system.

If the correct instrument system was used, compare the current chromatograms to a past analysis. If the chromatography has changed substantially, determine and correct the problem with the instrument system and then re-inject the samples. If the chromatography has not changed substantially the run may be accepted.

##### 10.2 Drifts

Verify that all calculations are correct.

### 10.3 RSD

Verify that all calculations are correct.

#### **10.4 Correlation Coefficient/ RE of Standards**

Verify that all concentrations, the regression model, integration, and calculations are correct.

If the standards still fail after correcting any calculation errors, repeat the analysis from the beginning if possible. The Study Director may choose to accept data with standards outside the normal acceptance range.

## 12.0 DATA REVIEW

## 12.1 Technical Review

Review at least the following to assure they are acceptable: rejection of calibration standards, integration of chromatograms, chromatography data processing and acquisition parameters, calibration standard concentrations, regression model, and compliance of data with acceptance criteria.

Manual Number:

Battelle SOP Number: COMSPEC.II-055-03

#### **12.2 Data Accuracy Review**

Review at least the following: completeness and correctness of data entry, formulas used to calculate all values, and accuracy of calculations.

#### **13.0 REVISION HISTORY**

- Reformat to reflect TOXBC template styles.
- Minor clerical changes made throughout.
- Added Sample Rotator to Table 2.
- Revised instructions for section 6.7.2
- Revised Tables 7 and 8.

#### **14.0 SIGNATURES**

Technical Review Signature/Date:

---

Signature of the technical reviewer will be considered documentation that all modifications and/or changes to this SOP (documented during the course of conducting this task) are technically acceptable and have no adverse technical impact unless otherwise noted. Changes or deviations to the acceptance criteria section require independent assessment by the technical reviewer.

## 1.0 INTRODUCTION

This report contains a description of the analysis of the rat plasma samples from this study, the results of these analyses, and figures.

This work was performed at Battelle, 505 King Avenue, Columbus, OH 43201.

## 2.0 ANALYTICAL STANDARDS

Nicotine, Lot No. 028K4056 with a purity of 99.5 percent, was obtained from Sigma-Aldrich. It was used to prepare calibration standards and QC samples for the analyses. This standard was stored at room temperature with a retest date of January 2011.

Nicotine, Lot No. 089K4011 with a purity of 99.5 percent, was obtained from Sigma-Aldrich. It was used to prepare calibration standards and QC samples for the analyses. This standard was stored at room temperature with a retest date of June 2012.

Nicotine-d<sub>3</sub> salicylate, Lot No. 048K4040 with a purity of 99.5 percent, was obtained from Sigma-Aldrich. It was used as an internal standard (IS) for nicotine for the analyses. Two separate aliquots of this lot were received and stored at room temperature with expiration dates of September, 2013 and May 28, 2015, respectively.

Cotinine, Lot No. 048K4031 with a purity of 99 percent, was obtained from Sigma-Aldrich. It was used to prepare calibration standards and QC samples for the analyses. This standard was stored refrigerated with a retest date of March 2010.

Cotinine, Lot No. 109K4051 with a purity of 99 percent, was obtained from Sigma-Aldrich. It was used to prepare calibration standards and QC samples for the analyses. This standard was stored refrigerated with a retest date of September 2012.

Cotinine-d<sub>3</sub>, Lot No. IS1107 with a minimum purity of 99 percent, was obtained from Sigma-Aldrich. It was used as an IS for cotinine for the analyses. Two separate aliquots of this lot were received and stored at room temperature with expiration dates of June, 2013 and June 1, 2015, respectively.

These standards were used to perform all work covered in this report.

## 3.0 MATRIX/ANTICOAGULANT

Wistar Han rat plasma with tripotassium ethylene diamine tetraacetic acid (K<sub>3</sub> EDTA), received from Bioreclamation, Inc. was used as the matrix for this study.

## 4.0 PLASMA SAMPLE ANALYSIS

### 4.1 Sample Receipt

Rat plasma samples were received frozen from Battelle Toxicology Group for the "2-Year Chronic Toxicity/Carcinogenicity Study of Tobacco Blend and Aqueous Tobacco Extract in Wistar Han Rats" study for analysis of nicotine and cotinine plasma concentration levels. A total of 70 samples were received frozen on each of the following dates: April 13, 2009, June 3, 2009, October 1, 2009, February 3, 2010, June 4, 2010, and February 3, 2011 in good condition and stored within the Chemistry Technical Center at approximately -70°C until analysis. A total of 71 samples were received frozen on September 29, 2010 in good condition and stored within the Chemistry Technical Center at approximately -70°C until analysis.

### 4.2 Analytical Method

(b) (4)

### 4.3 Results

A summary of each sample analysis, including any discrepancies, is shown in Table 1.

**Table 1. Summary of Sample Analyses**

<b>Analysis Date</b>	<b>Analysis Set</b>	<b>Discrepancies and Acceptance Criteria</b>	<b>Data Reported?</b>

The calibration standards used to generate the calibration curves from all reported runs met acceptance criteria [r, the correlation coefficient, greater than or equal to 0.99; average relative error (RE) within 15 percent of nominal for all standards except the lowest standard, which should have an average RE within 20 percent] for both nicotine and cotinine. The results of the calibration standards are presented in Table 2 for nicotine and Table 3 for cotinine.

The blanks met acceptance criteria (average response no greater than 50 or 30 percent of the average response of the lowest acceptable standard) in all runs for both nicotine and cotinine, respectively, with the exception of the October 8, 2010 run, in which the blanks failed acceptance criteria for nicotine. It was believed that the higher background in the blanks was related to the lot of blank plasma used for this analysis set and not related to the study samples, as all control study samples in this analysis set were BLOQ. The results from this run were reviewed and accepted with the acknowledgement of the Study Director.

The QC samples met all acceptance criteria [average determined concentration within 15 percent of the nominal concentration and relative standard deviation (RSD) less than or equal to 15 percent] in all runs for both nicotine and cotinine. The results of the QC samples are presented in Table 4 for nicotine and Table 5 for cotinine.

Representative overlaid full and reduced scale chromatograms of high and low concentration plasma standards, a plasma blank with IS, and a plasma blank are shown in Figures 1 and 2 for nicotine and in Figures 3 and 4 for cotinine. A representative overlay of full scale chromatograms of high and low plasma concentration calibration standards, a plasma blank with IS, and a plasma blank is shown in Figure 5 for nicotine-d<sub>3</sub> salicylate (the IS for nicotine) and in Figure 6 for cotinine-d<sub>3</sub> (the IS for cotinine). Example analysis set chromatograms of sample subjects along with calibration standards, blanks, and QC samples from the Week 83 analysis are provided in Appendix B.

The results from the analyses for nicotine and cotinine are shown in Tables 6 through 19. Any samples with calculated concentrations below the limit of quantitation are listed as BLOQ. Any samples with no detected concentration are listed as ND.

**5.0 AMENDMENTS/DEVIATIONS****5.1 Amendments**

Protocol Amendment 1 revised the plasma collection weeks, changing Weeks 4 and 13 to Weeks 5 and 14. The other changes in this amendment did not impact the bioanalytical sample analysis portion of the study.

**5.2 Deviations**

The bioanalytical sample analysis raw data contained minor SOP deviations that did not impact the study results.

On September 17, 2009 the refrigerator containing solutions used in the bioanalytical sample analysis was outside the acceptable temperature range of 2 to 8°C (approximately 10°C) for a period of time exceeding 60 minutes, the acceptable time limit for temperature deviations as defined by SOP. The refrigerator had returned to an acceptable temperature within 24 hours. This deviation is believed to be a result of normal day-to-day usage of the refrigerator and was determined by the study director to have no negative impact on the study.

## V. PROCEDURE

### A. GENERAL INSTRUCTIONS

USE TWO PAIR OF DISSIMILAR GLOVES DURING NEAT CHEMICAL HANDLING.

Calibrate all required balances according to the SOP on balance usage.

Make equivalent dilutions when the volume needed varies from the volume stated in the method.

Label all standard and reagent solutions as specified in the appropriate SOP.

Document all materials, equipment, and the chromatographic parameters. Initial on the top of each page of this document to signify that you have followed the instructions as written, all materials and reagents are current, and all equipment has been properly calibrated.

Initial and date the top of the page on the day that the work for that page was begun. Other entries made by the analyst on a later date or entries made by another person will be initialed and dated near the data entry.

The procedures are written in general chronological order. However, it is not essential that all sections be performed sequentially. The analyst may determine the order for conducting the task in the most efficient manner, unless the order for certain activities is specified.

Line through any section that is not needed for a specific task.

**TOXICOKINETIC ANALYSIS REPORT AMENDMENT**

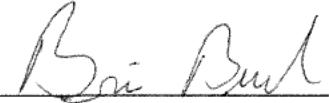

Following further review of the signed pharmacokinetic report, it was determined that clarification needed to be added to the description of the control group in the study design and the concluding statements concerning the comparison of the systemic effects of the blend and extract formulations.

This report was amended to include the following changes.

Section 2.1 Study Design. Changed sentence from "An additional control group received no nicotine" to "An additional control group was not treated with either the tobacco blend or the tobacco extract test articles."

Section 4.0 Conclusions. Changed sentence from "Overall, the blend, more often than not, had higher mean  $C_{max}$  values than the extract for a given dose and study week" to "Overall, the blend had generally similar  $C_{max}$  values compared to the extract for a given dose and study week."

The amended pages are designated with "*Amended*," and include the cover page and pages ia, ii, 1, and 9.

## 1.0 INTRODUCTION

The purpose of this study was to compare toxicity of a tobacco blend, aqueous tobacco extract, and appropriate controls in rodents (diet negative control). This study also included the determination of plasma concentrations of nicotine and cotinine under various conditions of test article exposure.

A kinetic analysis was performed using an experimentally-determined  $T_{max}$  of midnight (12:00 AM) and the corresponding  $C_{max}$  values for nicotine and cotinine that were achieved in Wistar Hannover rats exposed to various dosed feed formulations of nicotine up to a 101-week exposure period.

## 2.0 TOXICOKINETIC (TK) DATA ANALYSIS

Only information pertinent to the TK analysis is presented in this report. For additional details about the study, refer to the overall study report.

### 2.1 Study Design

The test system used was the male and female Wistar Han rat. For TK evaluation, animals were exposed by dosed feed to tobacco blend or tobacco extract daily for up to 101 weeks at nicotine target doses of 0.2, 2, or 5 mg/kg/day for tobacco blend or 0.2, 2, or 5 mg/kg/day tobacco extract. An additional control group was not treated with either the tobacco blend or the tobacco extract test articles. The treatment groups are designated as C, Bx, and Ex, where "x" refers to the target exposure level and the letters refer to control, blend, and extract, respectively.

Blood samples were collected from up to six rats/sex/group on Weeks 5, 14, 31, 49, 66, 83, and 101 at a single target time of 12:00 AM. The 12:00 AM time point was determined from a previous 28-day toxicity study in rat (see Study No. CN49730C). Several of the animals had samples collected outside of the range of 11:36 PM to 12:27 AM. However, these samples were determined to be sufficiently close to be used in the analysis. TK analysis was performed using the target dose (mg/kg/day), target sample collection time (clock time), and the measured concentrations of nicotine and cotinine (ng/mL).

## 3.0 RESULTS

Mean  $C_{max}$  values were evaluated for the following:

- An exposure level effect for a given treatment group, gender, and analyte
- A gender effect for a given treatment group, exposure level, and analyte
- A treatment group effect for a given exposure level, gender, and analyte

- A comparison of the nicotine and cotinine values for a given treatment group, exposure level, gender, and time period.

### 3.1 Week 5

Group mean  $C_{max}$  values determined at 12:00 AM on Week 5 are reported in Table 1 and graphically presented in Figure 1 (tobacco blend) and Figure 2 (tobacco extract).

All control group animal samples were either below the limit of quantitation (BLOQ) or not determined (ND).

The tobacco blend and tobacco extract groups exhibited increasing nicotine and cotinine mean  $C_{max}$  values with increasing dose for males and females.

Male and female rats had similar  $C_{max}$  values (less than 2-fold difference) for a given treatment group and exposure level for both nicotine and cotinine.

The tobacco blend and tobacco extract groups had similar nicotine and cotinine mean  $C_{max}$  values when comparing the same exposure level (less than 2-fold difference) for both genders.

Cotinine  $C_{max}$  values were 7.38- to 14.7-fold greater than nicotine values for a given treatment group and exposure level, for all male and female groups.

#### 3.1.1 Week 5 $C_{max}$ Values

	Female	104 ± 23	775 ± 76

### 3.2 Week 14

Group mean  $C_{max}$  values determined at 12:00 AM on Week 14 are reported in Table 2 and graphically presented in Figure 3 (tobacco blend) and Figure 4 (tobacco extract).

All control group animal samples were either BLOQ or ND.

The tobacco blend and tobacco extract groups exhibited increasing nicotine and cotinine mean  $C_{max}$  values with increasing dose for males and females.

Male and female rats had similar  $C_{max}$  values (less than 2-fold difference) for a given treatment group and exposure level for both nicotine and cotinine.

The tobacco blend and tobacco extract groups had similar nicotine and cotinine mean  $C_{max}$  values when comparing the same exposure level (less than 2-fold difference) for both genders.

Cotinine  $C_{max}$  values were 9.40- to 14.9-fold greater than nicotine values for a given treatment group and exposure level, for all male and female groups.

A comparison of Week 5 to Week 14 values for a given group were similar (less than 2-fold difference) for males and females and for nicotine and cotinine.

#### 3.2.1 Week 14 $C_{max}$ Values

### 3.3 Week 31

Group mean  $C_{max}$  values determined at 12:00 AM on Week 31 are reported in Table 3 and graphically presented in Figure 5 (tobacco blend) and Figure 6 (tobacco extract).

All control group animal samples were either BLOQ or ND.

The tobacco blend and tobacco extract groups exhibited increasing nicotine and cotinine mean  $C_{max}$  values with increasing dose for males and females.

Male and female rats had similar  $C_{max}$  values (less than 2-fold difference) for a given treatment group and exposure level for both nicotine and cotinine.

The tobacco blend and tobacco extract groups had similar nicotine and cotinine mean  $C_{max}$  values when comparing the same exposure level (less than 2-fold difference) for both genders.

Cotinine  $C_{max}$  values were 6.85- to 17.9-fold greater than nicotine values for a given treatment group and exposure level, for all male and female groups.

A comparison of Weeks 5 and 14 to Week 31 values for a given group were similar (less than 2-fold difference) for males and females and for nicotine and cotinine except for the B2 female nicotine  $C_{max}$  which was higher on Week 5 than Week 31.

### 3.4 Week 49

Group mean  $C_{max}$  values determined at 12:00 AM on Week 49 are reported in Table 4 and graphically presented in Figure 7 (tobacco blend) and Figure 8 (tobacco extract).

All control group animal samples were either BLOQ or ND.

The tobacco blend and tobacco extract groups exhibited increasing nicotine and cotinine mean  $C_{max}$  values with increasing dose for males and females.

Male and female rats had similar  $C_{max}$  values (less than 2-fold difference) for a given treatment group and exposure level for both nicotine and cotinine.

The tobacco blend and tobacco extract groups had similar nicotine and cotinine mean  $C_{max}$  values when comparing the same exposure level (less than 2-fold difference) for both genders.

Cotinine  $C_{max}$  values were 8.73- to 14.1-fold greater than nicotine values for a given treatment group and exposure level, for all male and female groups.

A comparison of Weeks 5, 14, and 31 to Week 49 values for a given group were similar (less than 2-fold difference) for males and females and for nicotine and cotinine.

### 3.5 Week 66

Group mean  $C_{max}$  values determined at 12:00 AM on Week 66 are reported in Table 5 and graphically presented in Figure 9 (tobacco blend) and Figure 10 (tobacco extract).

All control group animal samples were either BLOQ or ND.

The tobacco blend and tobacco extract groups exhibited increasing nicotine and cotinine mean  $C_{max}$  values with increasing dose for males and females except for the nicotine  $C_{max}$  values for the females which decreased after an increase in dose from the B2 group to the B5 group. The female cotinine  $C_{max}$  values for these groups were similar but did increase slightly for the B5 group.

Male and female rats had similar  $C_{max}$  values (less than 2-fold difference) for a given treatment group and exposure level for both nicotine and cotinine.

The tobacco blend and tobacco extract groups had similar nicotine and cotinine mean  $C_{max}$  values when comparing the same exposure level (less than 2-fold difference) for both genders except for the B5 female group which had 2.1-fold lower nicotine values than the E5 group.

Cotinine  $C_{max}$  values were 7.85- to 17.5-fold greater than nicotine values for a given treatment group and exposure level, for all male and female groups.

A comparison of Weeks 5, 14, 31, and 49 to Week 66 values for a given group were similar (less than 2-fold difference) for males and females and for nicotine and cotinine except for the female B5 group which was lower than Week 5 for nicotine and lower than Weeks 14, 31, and 49 for cotinine.

	Female	108 ± 9	966 ± 146

### 3.6 Week 83

Group mean C<sub>max</sub> values determined at 12:00 AM on Week 83 are reported in Table 6 and graphically presented in Figure 11 (tobacco blend) and Figure 12 (tobacco extract).

All control group animal samples were either BLOQ or ND.

The tobacco blend and tobacco extract groups exhibited increasing nicotine and cotinine mean C<sub>max</sub> values with increasing dose for males and females.

Male and female rats had similar C<sub>max</sub> values (less than 2-fold difference) for a given treatment group and exposure level for both nicotine and cotinine.

The tobacco blend and tobacco extract groups had similar nicotine and cotinine mean C<sub>max</sub> values (less than 2-fold difference) when comparing the same exposure level for both genders.

Cotinine C<sub>max</sub> values were 8.31- to 14.4-fold greater than nicotine values for a given treatment group and exposure level, for all male and female groups.

A comparison of Weeks 5, 14, 31, 49, and 66 to Week 83 values for a given group were similar (less than 2-fold difference) for males and females and for nicotine and cotinine except for the female B5 group which was higher than Week 66 for cotinine.

### 3.6.1 Week 83 C<sub>max</sub> Values

	Female	70.7 ± 21.2	961 ± 139

### 3.7 Week 101

Group mean C<sub>max</sub> values determined at 12:00 AM on Week 101 are reported in Table 7 and graphically presented in Figure 13 (tobacco blend) and Figure 14 (tobacco extract).

All control group animal samples were either BLOQ or ND.

The tobacco blend and tobacco extract groups exhibited increasing nicotine and cotinine mean C<sub>max</sub> values with increasing dose for males and females.

Male and female rats had similar C<sub>max</sub> values (less than 2-fold difference) for a given treatment group and exposure level for both nicotine and cotinine.

The tobacco blend and tobacco extract groups had similar nicotine and cotinine mean C<sub>max</sub> values when comparing the same exposure level (less than 2-fold difference) for both genders.

Cotinine C<sub>max</sub> values were 8.72- to 14.0-fold greater than nicotine values for a given treatment group and exposure level, for all male and female groups.

A comparison of Weeks 5, 14, 31, 49, 66, and 83 to Week 101 values for a given group were similar (less than 2-fold difference) for males and females and for nicotine and cotinine.

## 4.0 CONCLUSIONS

T<sub>max</sub> (i.e., 12:00 AM) was experimentally-determined from the previous 28-day toxicity study (Study No. CN49730C). The C<sub>max</sub> values in the present study were used to evaluate systemic exposure to nicotine and cotinine, as well as to allow for relationships between gender, varying formulations, exposure level, and exposure duration to be evaluated.

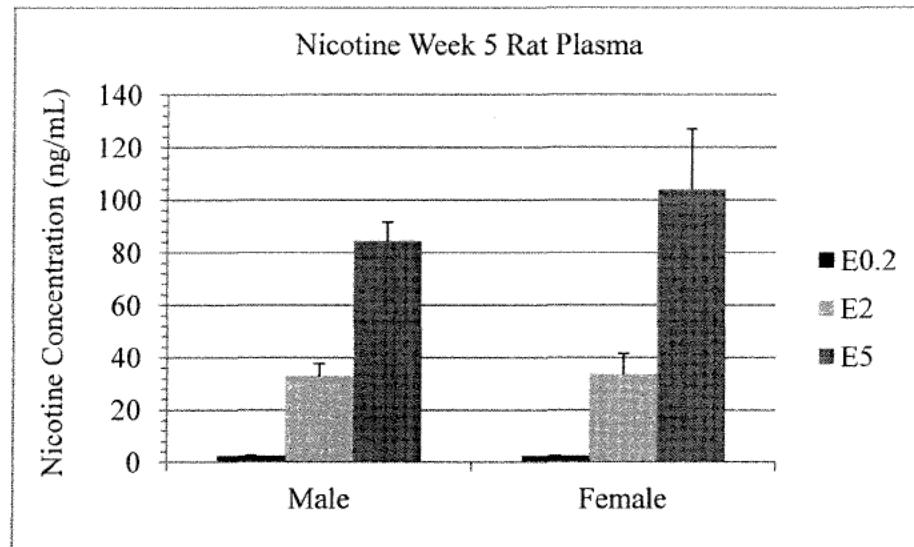

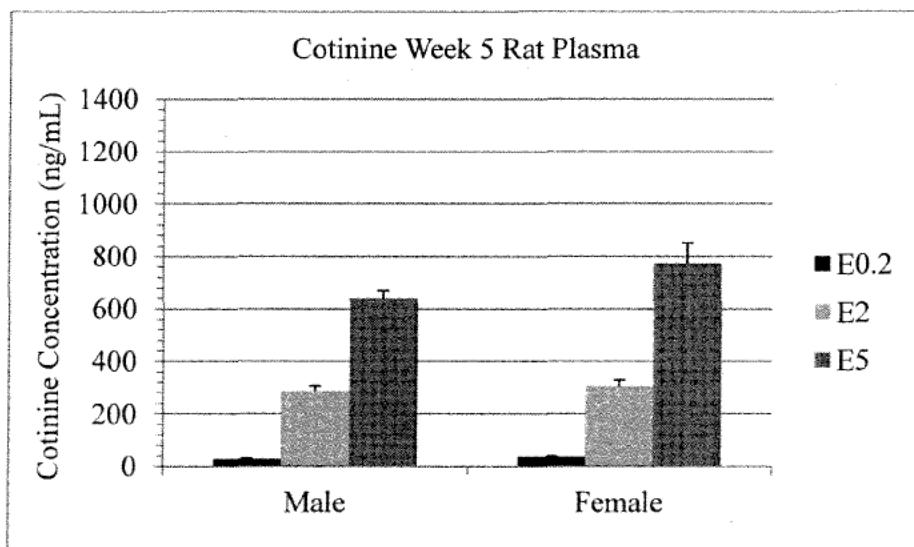

There was no overt gender effect, however mean nicotine C<sub>max</sub> values tended to be slightly higher for females than males for the B0.2, B2, E0.2, and E2 groups, and mean cotinine C<sub>max</sub> values tended to be higher in females than males for all dose groups.

There were no overt formulation effects as tobacco extract and tobacco blend formulations at a given exposure level had similar C<sub>max</sub> values for both males and females. The C<sub>max</sub> values increased approximately proportionally with an increase in exposure level for both the tobacco extract and tobacco blend with the one exception of the female B5 group on Week 66 that had lower than expected mean C<sub>max</sub> values for nicotine and cotinine. Overall, the blend had generally similar C<sub>max</sub> values compared to the extract for a given dose and study week.

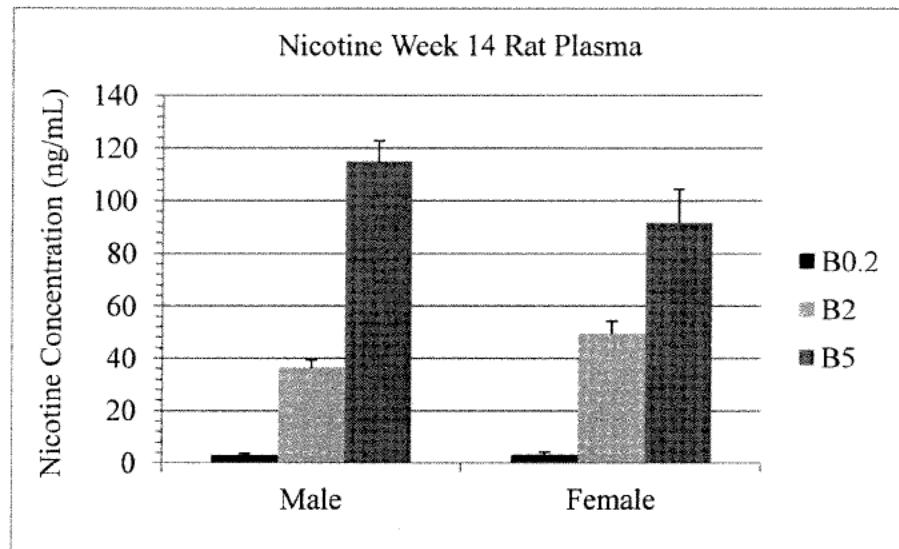

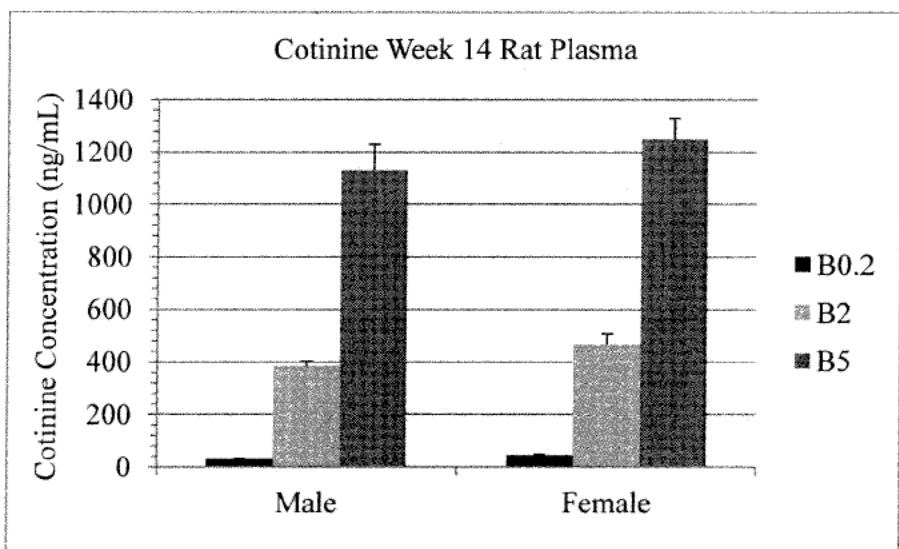

There was no consistent increase or decrease in group mean nicotine or cotinine C<sub>max</sub> values over time (Figures 15 through 20). C<sub>max</sub> values were, in general, similar on all study weeks for a given exposure level and gender suggesting no induction or accumulation of nicotine or cotinine occurred.

## 1.0 MATERIALS AND METHODS

Ophthalmic examinations were performed on all potential core carcinogenicity animals during the pretest phase (Days -8, -11, and -12 for males, Days -8 and -9 for females), and on all core carcinogenicity study animals on Days 374, 379, 718, and 722 for males and Days 374, 377, 720, and 721 for females. The Control-B group (CBM, CBF) and sentinels were excluded from ophthalmic examinations.

The pupils of the animals were dilated by instillation of 1% Tropicamide Ophthalmic Solution (Bausch and Lomb) into each eye before examination.

Each ophthalmic examination included an examination of the adnexal structures, a direct examination of anterior segment of the eye, and an indirect examination of the posterior segment of the eye. Examination of adnexal structures included conjunctiva, eyelids, and eyelashes. Structures examined in the anterior segment of the eye included the cornea, sclera, iris, pupil, lens, aqueous humor, and anterior chamber. Structures examined in the posterior segment of the eye included the vitreous humor, retina, and optic disc.

A Zeiss Hand Slit Lamp HSO 10 was utilized for all direct ophthalmic examinations. A Keeler All Pupil Indirect Ophthalmoscope with a Volk 30 diopter double aspheric lens was utilized for all indirect ophthalmic examinations.

## 2.0 PRETEST RESULTS

One hundred fourteen out of 525 male animals were found to have ocular abnormalities. Of these, 90 exhibited corneal crystals (CC1: structures can be easily visualized through the corneal crystals, without impairment) in one or both eyes, 2 exhibited corneal crystals (CC2: structures can be visualized through the corneal crystals, with impairment), 22 exhibited a persistent pupillary membrane, 1 exhibited a persistent hyaloid, and 2 exhibited a cataract. Ninety-three out of 523 female animals were found to have ocular abnormalities. Of these, 57 exhibited corneal crystals (CC1) in one or both eyes, 1 exhibited corneal crystals (CC2), 24 exhibited a persistent pupillary membrane, 2 exhibited a persistent hyaloid, 9 exhibited a cataract, and 1 had a prominent Y suture.

All other animals were noted as normal during the ophthalmic examinations.

Animals with ocular abnormalities other than CC1s were excluded from the assignment to the core carcinogenicity groups.

**3.0 DAY 374 and 379 (males), DAY 374 and 377 (females) RESULTS**

Three hundred eighty-five out of 831 core carcinogenicity animals examined had CC1s (Table 1). There were no other ophthalmic findings for core carcinogenicity animals assigned to the study.

**4.0 DAY 718 and 722 (males), DAY 720 and 721 (females) RESULTS**

Five hundred eighty-nine out of 684 core carcinogenicity animals examined had CC1's (Table 1).

Ten out of 351 male core carcinogenicity animals were found to have ocular abnormalities other than CC1s: 1 Control-A (CM) had CC2 in one eye, 1 tobacco blend intermediate dose (B2M) had CC2 in one eye, 2 tobacco blend high dose (B5M) had anterior synechiae in one eye, 1 B5M had corneal vascularization in one eye, 1 B5M had a cataract in one eye, 1 tobacco extract low dose (E0.2M) had a corneal opacity that prevented evaluation of deeper structures, 1 tobacco extract intermediate dose (E2M) had cataracts in both eyes, 1 E2M had CC2 in one eye, and 1 E5M had CC2 in one eye.

Six out of 333 female core carcinogenicity animals examined were found to have ocular abnormalities other than CC1s: 1 tobacco blend low dose (B0.2F) had CC2 in one eye, 1 tobacco blend intermediate dose (B2F) had a scar in the lower eyelid, 1 tobacco extract low dose female (E0.2F) had CC2 in one eye, 1 E0.2F had a cataract in one eye, 1 tobacco extract intermediate dose (E2F) had CC2 in one eye, and 1 tobacco extract high dose (E5F) had corneal opacity vascularization that prevented evaluation of deeper structures.

**5.0 CONCLUSIONS**

No apparent test article related abnormalities were noted during the study.

Animal ID: 121	Group: CM	
Day of Death: 729	Terminal Body Weight: 660.8 g	
Tissue	Gross Observation(s)	Microscopic Observation(s)
Adrenal Gland	No gross observed on tissue.	Hyperplasia, cortex, mild. Hypertrophy, cortex, mild.
Kidney	No gross observed on tissue.	Hydronephrosis, minimal.
Liver	No gross observed on tissue.	Focus, basophilic cell, present.
Pituitary Gland	No gross observed on tissue.	Hyperplasia, pars distalis, minimal.
Skin	Crust(s), pedal (foot), red, left, G1/ G1 size = 15x8mm.  Crust(s), pedal (foot), red, right, G2/ G2 size = 5x5mm.	Ulcer, epidermis, marked. Inflammation, mild.  Note: G1 = inflammation, G2 = epidermal ulceration.

**Protocol tissues were examined grossly unless otherwise noted. All gross observations are listed above; tissues not listed were grossly unremarkable. The following tissues were examined microscopically and found unremarkable:**

Bone Marrow; Brain; Cecum; Colon; Duodenum; Epididymis; Esophagus; Eye; Femur; Harderian Gland; Heart; Ileum; Jejunum; Lung; Lymph Node, Mesenteric; Mammary Gland; Nose/Turbinate; Oral Mucosa; Pancreas; Parathyroid; Pharynx; Preputial Gland; Prostate; Rectum; Salivary Gland; Sciatic Nerve; Seminal Vesicle; Skeletal Muscle; Spinal Cord; Spleen; Sternum; Stomach; Testis; Thymus; Thyroid Gland; Tongue; Trachea; Urinary Bladder; Zymbal's Gland

Animal ID: 122	Group: CM	
Day of Death: 729	Terminal Body Weight: 470.0 g	
Tissue	Gross Observation(s)	Microscopic Observation(s)
Adrenal Gland	No gross observed on tissue.	Hyperplasia, cortex, minimal. Vacuolization, cytoplasm, cortex, minimal.
Heart	No gross observed on tissue.	Cardiomyopathy, minimal.
Kidney	No gross observed on tissue.	Nephropathy, minimal.
Liver	No gross observed on tissue.	Hyperplasia, bile duct, minimal. Lipidosis, multifocal, minimal.
Prostate	No gross observed on tissue.	Hyperplasia, duct epithelium, minimal.
Skin	Crust(s), inguinal, red, G1/ G1 size = 9x7mm. Crust(s), pedal (foot), red, right, G2/ G2 size = 2x2mm.	Ulcer, epidermis, marked. Inflammation, marked. Note: G1 = epidermal ulcer and inflammation. G2 = inflammation.

**Protocol tissues were examined grossly unless otherwise noted. All gross observations are listed above; tissues not listed were grossly unremarkable. The following tissues were examined microscopically and found unremarkable:**

Bone Marrow; Brain; Cecum; Colon; Duodenum; Epididymis; Esophagus; Eye; Femur; Harderian Gland; Ileum; Jejunum; Lung; Lymph Node, Mesenteric; Mammary Gland; Nose/Turbinates; Oral Mucosa; Pancreas; Parathyroid; Pharynx; Pituitary Gland; Preputial Gland; Rectum; Salivary Gland; Sciatic Nerve; Seminal Vesicle; Skeletal Muscle; Spinal Cord; Spleen; Sternum; Stomach; Testis; Thymus; Thyroid Gland; Tongue; Trachea; Urinary Bladder; Zymbal's Gland

Day of Death: 737	Terminal Body Weight: 265.6 g	
Tissue	Gross Observation(s)	Microscopic Observation(s)
Adrenal Gland	No gross observed on tissue.	Hypertrophy, cortex, minimal.
Colon	No gross observed on tissue.	Hyperplasia, lymphoid, submucosa, mild.
Kidney	No gross observed on tissue.	Nephropathy, minimal.
Liver	No gross observed on tissue.	Hyperplasia, bile duct, mild. Focus, basophilic cell, present.
Lung	No gross observed on tissue.	Alveolar macrophages, increased, minimal. Inflammation, mild.
Mammary Gland	Mass, inguinal, left, tan, 20 x 13 x 10 mm, G3.	B-adenoma, mortality independent. Note: G3 = adenoma.
Ovary	Cyst(s), bilateral, clear, G2/ left = 5 mm diamter; right = 7 mm diameter.	Cyst(s), present. Note: G2 = cyst.
Pituitary Gland	Enlarged, 7 x 5 x 4 mm, dark, G1.	B-adenoma, pars distalis, mortality independent. Note: G1 = adenoma, pd.

**Protocol tissues were examined grossly unless otherwise noted. All gross observations are listed above; tissues not listed were grossly unremarkable. The following tissues were examined microscopically and found unremarkable:**

Bone Marrow; Brain; Cecum; Clitoral Gland; Duodenum; Esophagus; Eye; Femur; Harderian Gland; Heart; Ileum; Jejunum; Lymph Node, Mesenteric; Nose/Turbinate; Oral Mucosa; Pancreas; Parathyroid; Pharynx; Rectum; Salivary Gland; Sciatic Nerve; Skeletal Muscle; Skin; Spinal Cord; Spleen; Sternum; Stomach; Thymus; Thyroid Gland; Tongue; Trachea; Urinary Bladder; Uterus; Vagina; Zymbal's Gland

## 1.0 INTRODUCTION

The purpose of this study was to compare the toxicity and carcinogenicity of a tobacco blend (TB) and aqueous tobacco extract (TE) with a diet negative control in Wistar Han rats after approximately 24 months. Groups of male and female Wistar Han rats were given either untreated feed (diet negative control) or various amounts of TB or TE as summarized in Table 1. This narrative addresses the comparative carcinogenicity of TB and TE compared to control (Groups 1 and 2) after 24 months of exposure. Toxicity findings from the 12-month study were previously reported.

**Table 1. Summary of Study Design**

Group	Target Dosage of Nicotine (mg/kg/day)	Core Males	Core Females
1-Control-A (CM, CF) <sup>a</sup>	0	60	60
2-Control-B (CBM, CBF)	0	60	60
3-Tobacco Blend Low Dose (B0.2M, B0.2F)	0.2	60	60
4-Tobacco Blend Intermediate Dose (B2M, B2F)	2	60	60
5-Tobacco Blend High Dose (B5M, B5F)	5	60	60
6-Tobacco Extract Low Dose (E0.2M, E0.2F)	0.2	60	60
7-Tobacco Extract Intermediate Dose (E2M, E2F)	2	60	60
8-Tobacco Extract High Dose (E5M, E5F)	5	60	60

a. Dose group abbreviations are defined in the study file.

All core carcinogenicity rats (60 rats/sex/group) were necropsied (scheduled and unscheduled) and protocol-required tissues were placed in 10 percent neutral buffered formalin, with the exception of testes (preserved in Bouin's fixative then transferred to 70 percent ethanol) and eyes (preserved in Davidson's fixative then transferred to 10 percent neutral buffered formalin). All tissues from Groups 1 through 8 were processed to slides and examined microscopically by a board-certified veterinary pathologist. Macroscopic (gross) and microscopic diagnoses were entered into the PATH/TOX SYSTEM (Xybion Medical Systems Corporation) data management system for data recording and analysis. A small number of the tissues could not be successfully processed to slides for microscopic examination. Such tissues are listed as "missing" in the individual animal pathology data tables. The absence of microscopic results for these tissues was not considered to affect study interpretation.

**2.0 PATHOLOGY****2.1 Necropsy Results****2.1.1 Gross Pathology**

A few macroscopic findings were observed in this study at necropsy and at trim. To the fullest extent, macroscopic findings were correlated microscopically according to standard operating procedure (SOP). When compared to control, macroscopic findings did not appear related to TB or TE administration.

**2.2 Histopathology**

Nonneoplastic tissue changes were graded for severity, where appropriate, on a 1 to 4 scale, where 1 = minimal (the change barely exceeded normality), 2 = mild (change was clearly discernible and of questionable or minor pathologic significance), 3 = moderate (change was substantial and may cause/account for an alteration in tissue structure and/or function), and 4 = marked (change was essentially maximal).

In order to conduct a statistical analysis of tumor incidence among the appropriate dosage groups, each tumor observed microscopically was classified into either incidental, fatal, or mortality independent categories. Incidental tumors were defined as tumors that did not contribute to the unscheduled death of the animal; fatal tumors were defined as tumors assumed to have caused the unscheduled death of the animal; and mortality independent tumors were defined as tumors present at the scheduled study termination (terminal sacrifice), which therefore could not have been responsible for the animal's death, but can also not be assumed to be incidental. Coding of tumors in the data collection system occurred according to facility SOP.

Neoplasms were coded as benign (B), malignant (M), or infiltrative (F). Nonneoplastic findings were assigned a severity grade or coded as "present" without a severity grade (e.g., ovary cyst). Histologic notes were added during data entry, which correlated each macroscopic finding [numbered in order (G1, G2, G3, etc.) as they were recorded at necropsy] to a particular microscopic diagnosis. Table 2 summarizes the incidence of neoplastic and nonneoplastic findings in the uterus. A greater incidence of uterine carcinoma was observed in the B5F (12 percent, 7/59) and E5F (7 percent, 4/59) groups when compared to the incidence in the CF group (2 percent, 1/60) and CBF group (0/60). The incidences of uterine carcinoma in the B0.2F, B2F, E0.2F, and E2F groups were 5/60 (8.3 percent), 3/60 (5.0 percent) 3/60 (5.0 percent), and 0/60 (0.0 percent), respectively. The incidence of uterine carcinoma in all TB and TE groups was considered within an acceptable background level in Wistar Han rats<sup>1,4</sup> and thus deemed spontaneous in occurrence and unrelated to TB or TE exposure (Table 2).

Several additional neoplastic and nonneoplastic findings were observed in the low, mid, and high dose TB and TE groups. When compared to control (Groups 1 and 2), all such findings were typical of spontaneous background changes observed in untreated Wistar Han rats;<sup>2,3,4</sup> were interpreted to be neither toxicologically nor biologically significant, and lacked a dose response. None of the microscopic findings in this study were interpreted to be due to exposure to the TB or TE test articles.

### 3.0 CONCLUSIONS

There were no treatment related gross or microscopic findings following exposure of Wistar Han male and female rats up to a target dosage of 5 mg/kg/day of nicotine in TB and TE administered in dosed feed for approximately 24 months.

## 1.0 INTRODUCTION

The purpose of this study was to compare the toxicity and carcinogenicity of a tobacco blend (TB) and aqueous tobacco extract (TE) with a diet negative control in Wistar Han rats after approximately 24 months. Groups of male and female Wistar Han rats were given either untreated feed (diet negative control) or various amounts of TB or TE as summarized in Table 1. This narrative addresses only the comparative carcinogenicity of TB and TE in the control (Group 1), high dose TB (Group 5), and high dose TE (Group 8) dosage groups after 24 months of exposure. Toxicity findings from the 12-month study were previously reported.

**Table 1. Summary of Study Design**

Group	Target Dosage of Nicotine (mg/kg/day)	Core Males	Core Females
1-Control-A (CM, CF) <sup>a,b</sup>	0	60	60
2-Control-B (CBM, CBF)	0	60	60
3-Tobacco Blend Low Dose (B0.2M, B0.2F)	0.2	60	60
4-Tobacco Blend Intermediate Dose (B2M, B2F)	2	60	60
5-Tobacco Blend High Dose (B5M, B5F)	5	60	60
6-Tobacco Extract Low Dose (E0.2M, E0.2F)	0.2	60	60
7-Tobacco Extract Intermediate Dose (E2M, E2F)	2	60	60
8-Tobacco Extract High Dose (E5M, E5F)	5	60	60

a. Dose group abbreviations are defined in the study file.

b. The current narrative addresses microscopic findings for Groups 1, 5, and 8 only.

All core carcinogenicity rats (60 rats/sex/group) were necropsied (scheduled and unscheduled) and protocol-required tissues were placed in 10 percent neutral buffered formalin, with the exception of testes (preserved in Bouin's fixative then transferred to 70 percent ethanol) and eyes (preserved in Davidson's fixative then transferred to 10 percent neutral buffered formalin). All tissues from Groups 1, 5, and 8 were processed to slides and examined microscopically by a board-certified veterinary pathologist. Macroscopic (gross) and microscopic findings were recorded electronically using the PATH/TOX SYSTEM (Xybion Medical Systems Corporation). A small number of the tissues could not be successfully processed to slides for microscopic examination. Such tissues are listed as "missing" in the individual animal pathology data tables. The absence of microscopic results for these tissues was not considered to affect study interpretation.

**2.0 PATHOLOGY****2.1 Necropsy Results****2.1.1 Gross Pathology**

A few macroscopic findings were observed in this study at necropsy and at trim. To the fullest extent, macroscopic findings were correlated microscopically according to standard operating procedure (SOP). When compared to control, macroscopic findings did not appear related to TB or TE administration.

**2.2 Histopathology**

Nonneoplastic tissue changes were graded for severity, where appropriate, on a 0 to 4 scale, where 0 = normal, 1 = minimal (the change barely exceeded normality), 2 = mild (change was clearly discernible and of questionable or minor pathologic significance), 3 = moderate (change was substantial and may cause/account for an alteration in tissue structure and/or function), and 4 = marked (change was essentially maximal).

In order to conduct a statistical analysis of tumor incidence among the appropriate dosage groups, each tumor observed microscopically was classified into either incidental, fatal, or mortality independent categories. Incidental tumors were defined as tumors that did not contribute to the death of the animal; fatal tumors were defined as tumors assumed to have caused the death of the animal; and mortality independent tumors were defined as tumors present at study termination, which therefore could not have been responsible for the animal's death, but can also not be assumed to be incidental. Coding of tumors in the data collection system occurred according to facility SOP.

Neoplasms were coded as benign (B), malignant (M), or infiltrative (F). Nonneoplastic findings were assigned a severity grade or coded as "present" without a severity grade (e.g. ovary cyst). Histologic notes were added during data entry, which correlated each macroscopic finding [numbered in order (G1, G2, G3, etc.) as they were recorded at necropsy] to a particular microscopic diagnosis. Table 2 summarizes the incidence of neoplastic and nonneoplastic findings in the uterus. A greater incidence of uterine carcinoma was observed in the B5F (12 percent, 7/59) and E5F (7 percent, 4/59) groups when compared to the incidence in the CF group (2 percent, 1/60). The incidence of uterine carcinoma in these groups was considered within an acceptable background level in Wistar Han rats<sup>1</sup> and thus deemed spontaneous in occurrence and unrelated to TB or TE exposure.

**Table 2. Incidences of Selected Neoplasms and Nonneoplastic Uterine Lesions for the 2-Year Carcinogenicity Study of Tobacco Blend and Aqueous Tobacco Extract in Wistar Han Rats**

Hyperplasia, endometrium, cystic		12	16	13
Thrombosis		0	1	0
Inflammation		2	1	0
Hyperplasia, endometrium, atypical		0	2	2

Several additional neoplastic and nonneoplastic findings were observed in the high dose TB and high dose TE groups. When compared to control (Group 1), all such findings were typical of spontaneous background changes observed in untreated Wistar Han rats<sup>2,3,4</sup> and were interpreted to be neither toxicologically nor biologically significant. None of the microscopic findings in this study were interpreted to be due to exposure to the TB or TE test articles.

### 3.0 CONCLUSIONS

There were no treatment related gross or microscopic findings following exposure of Wistar Han male and female rats at a target dosage of 5 mg/kg/day of nicotine in TB and TE administered in dosed feed for approximately 24 months.

Subject: Pathology Peer Review of Study CN49730G (2-Year Chronic  
Toxicity/carcinogenicity Study of Tobacco Blend and Aqueous Tobacco Extract in  
Wistar Han Rats) Report on Groups 1, 5 and 8

A routine GLP peer review was conducted of the Pathology Data from study CN49730G report on Groups 1, 5 and 8. The purpose was to verify the accuracy, consistency, and completeness of toxicologically significant findings, as rendered by the study pathologist, Dr. Anthony J. Skowronek. Sections of tissues from all animals examined microscopically were available for review, along with the gross/microscopic diagnoses, interpretations, and narrative generated by the study pathologist.

As part of this review, all tissues from the following animals were examined: 121, 131, 141, 151, 162, 521, 525, 531, 535, 541, 545, 551, 555, 561, 565, 571, 575, 821, 823, 825, 831, 833, 835, 841, 843, 845, 849, 1151, 1155, 1161, 1165, 1171, 1521, 1525, 1531, 1535, 1541, 1545, 1551, 1555, 1561, 1565, 1571, 1575, 1821, 1825, 1831, 1835, 1841, 1845, 1851, 1855, 1861, 1865, 1871, and 1875.

This review confirmed the diagnoses rendered by the study pathologist. There were no substantive differences between the findings of the study pathologist and the undersigned, and I am in agreement with the results, interpretations, and conclusions presented in this report of findings.

In addition to the peer review memo dated 8-31-11, the uterus from Females 1152, 1530, 1539, 1550, 1554, 1556, 1577, 1858, 1868, and 1879 were reviewed. Upon consensus between the study pathologist and peer review pathologist, it was determined that the uterine finding in Female 1554 was re-coded as "atypical endometrial hyperplasia."

This review confirmed the diagnoses rendered by the study pathologist. There were no substantive differences between the findings of the study pathologist and the undersigned, and I am in agreement with the results, interpretations, and conclusions presented in this report of findings.

## 1.0 INTRODUCTION

This report summarizes the statistical analysis of survival and tumor incidence data from a 2-year chronic toxicity/carcinogenicity study of two separate test articles, a tobacco blend and an aqueous tobacco extract from that blend, administered in the diet to Wistar Han rats. A total of 960 rats were used in this study for the core dosage groups for the 2-year timepoint, of which 480 were females and 480 were males. Animals were randomly assigned to eight core dosage groups by sex and body weight using a computer algorithm (PATH/TOX SYSTEM, Version 4.2.2), such that there were 60 rats per sex per group. There was an additional core sentinel group (30 animals per sex) that received diet without test articles. The eight dosage groups were fed diets without test articles, Control-A (Group 1) and Control-B (Group 2), or diets with two separate test articles, tobacco blend low dose (0.2 mg nicotine/kg/day, Group 3), tobacco blend intermediate dose (2 mg nicotine/kg/day, Group 4), tobacco blend high dose (5 mg nicotine/kg/day, Group 5), tobacco extract low dose (0.2 mg nicotine/kg/day, Group 6), tobacco extract intermediate dose (2 mg nicotine/kg/day, Group 7), and tobacco extract high dose (5 mg nicotine/kg/day, Group 8). In each core dosage group for the 2-year timepoint, 60 animals of each sex were used to assess potential toxicity and carcinogenicity. The dosage groups were abbreviated as CF, CBF, B0.2F, B2F, B5F, E0.2F, E2F, and E5F for females, and CM, CBM, B0.2M, B2M, B5M, E0.2M, E2M, and E5M for males, respectively.

### 1.1 Objectives of the Analysis

The objectives of the analysis were to determine whether significant differences in intercurrent mortalities occurred among the study groups within each test article versus corresponding controls, and whether significant linear dose-response trends existed in incidences of tumors among the following groups by test article:

#### 1.1.1 Tobacco Blend

- Group 1 and Groups 3 to 5
- Group 2 and Groups 3 to 5
- Groups 1 and 2 and Groups 3 to 5

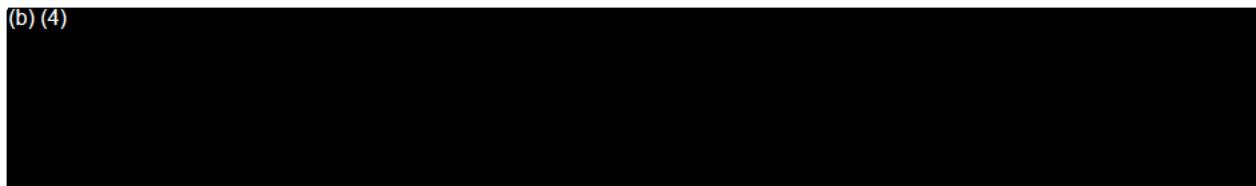

### **1.1.2 Tobacco Extract**

- Group 1 and Groups 6 to 8
- Group 2 and Groups 6 to 8
- Groups 1 and 2 and Groups 6 to 8

These analyses were conducted separately for males and females.

**3.0 RESULTS****3.1 Survival Analysis**

Kaplan-Meier survival curves for male and female rats are plotted in Figure 1 for all eight dosage groups. These survival curves are also displayed in Figure 2 and Figure 3 for tobacco blend and tobacco extract, respectively. Table 1 presents the frequency of early

(unscheduled) death animals and final (scheduled) sacrifice animals. Table 2 summarizes the median survival times as well as the mean survival time restricted to the longest final sacrifice times and their associated 95 percent confidence intervals. Table 3 presents the results of statistical tests of the survival data. The mean survival times were restricted to the longest final sacrifice times (i.e., 746 days), and were therefore underestimated.

There were no statistically significant differences in survival among groups in either the tobacco blend or tobacco extract groups, for either males or females (Table 2).

At least 68 percent of female animals in any dose groups survived until the final sacrifice, and the CBF and B2F had slightly more early deaths (Table 1) compared to the other dose groups. At least 75 percent of males in any dose group survived until the final sacrifice. The CBM and E5M groups had slightly more animals die early, and the B5M group had slightly fewer animals that died early (Table 1) compared to the other dose groups; however, these differences were not statistically significant. The median survival times are larger than the final sacrifice times for either females or males, as more than 50 percent of animals survived until the final sacrifice. In general, there were slightly more early deaths in females than males.

### **3.2 Tumor Analysis**

Table 4 and Table 5 present the results of statistical analyses of tumor incidence data for females for tobacco blend and tobacco extract, respectively. Table 6 and Table 7 present the results of statistical analyses of tumor incidence data for males for tobacco blend and tobacco extract, respectively. Also provided in these tables are the numbers of animals in each dose group with tumors for each tumor type of interest. As discussed in the method section, the mortality independent tumors were regarded as incidental tumors for the tumor analyses. If a specified type of tumor was observed in both incidental and fatal contexts among the dose groups involved in a given trend test, then the Peto's method was used for the given trend test for the specific tumor type. If the linear dose trends were statistically significant at the  $0.05/3=0.0167$  level, then the p-values were listed in the tables.

Trend test results with p-values  $\leq 0.05$  before multiple adjustments are presented in Appendix A. These tables were included for reporting purposes only, and were not

summarized within this report. In addition, p-values for all dose trend tests are presented in Appendix B and the data set used for the survival and tumor incidence statistical analysis is presented in Appendix C.

### **3.2.1 Results for Tobacco Blend**

The trend tests detected a statistically significant dose-response trend in tumor rates at the 0.0167 significance level in the following instances:

- Two decreasing dose response trends among groups CBF, B0.2F, B2F, and B5F and among groups CF, CBF, B0.2F, B2F, and B5F, for B-ADENOMA in MAMMARY GLAND: there were eight (three incidental and five mortality independent) tumors in the CF group, fourteen (two incidental, nine mortality independent and three fatal) tumors in the CBF group, nine (two incidental, five mortality independent and two fatal) tumors in the B0.2F group, ten (two incidental, six mortality independent and two fatal) tumors in the B2F group, and two (one incidental and one mortality independent) tumors in the B5F group (Table 4).
- An increasing dose response trend among groups CF, CBF, B0.2F, B2F, and B5F, M-CARCINOMA in the UTERUS: there was one (fatal) tumor in the CF group, five (two mortality independent and three fatal) tumors in the B0.2F group, three (one incidental, one mortality independent, and one fatal) tumors in the B2F group, seven (four mortality independent and three fatal) tumors in the B5F group, and no tumors in the CBF group (Table 4).
- An increasing dose response trend among groups CM, CBM, B0.2M, B2M, and B5M, for M-MESOTHELIOMA in the EPIDIDYMIS: there were three (mortality independent) tumors in B5M group and no tumors in the other male tobacco blend and the two male control groups (Table 6).

### **3.2.2 Results for Tobacco Extract**

The trend tests detected a statistically significant dose-response trend in tumor rates at the 0.0167 significance level in the following instances:

- A decreasing dose response trend among groups CF, E0.2F, E2F, and E5F, for M-CARCINOMA, BASAL CELL in SKIN: there were four (one mortality independent, one incidental, and two fatal) tumors in the CF group and no tumors in the female tobacco extract groups (Table 5).
- Three decreasing dose response trends among groups CM, E0.2M, E2M, and E5M for B-ADENOMA, FOLLICULAR CELL in the THYROID GLAND, among CBM, E0.2M, E2M, and E5M, and also CM, CBM, E0.2M, E2M, and E5M: there were seven (mortality independent) tumors in each of the CM and

CBM groups, four (three mortality independent and one incidental) tumors in E0.2M, four (mortality independent) tumors in E2M, and no tumors in E5M (Table 7).

#### 4.0 CONCLUSIONS

Analysis of the survival data indicated there was no difference in intercurrent mortalities among the study groups for either the males or females.

Summary tables including statistically significant ( $p \leq 0.0167$ ) trend tests are presented in Appendix D. The tumor analysis indicated that:

- There were decreasing dose response trends in tumor incidence rates observed for B-ADENOMA in MAMMARY GLAND for tobacco blend females, for M-CARCINOMA, BASAL CELL in SKIN for tobacco extract females, and for B-ADENOMA, FOLLICULAR CELL in the THYROID GLAND for tobacco extract males.
- There were increasing dose response trends in tumor incidences observed for M-CARCINOMA in the UTERUS for tobacco blend females, and in M-MESOTHELIOMA in the EPIDIDYMIS for tobacco blend males.
- There were no increasing dose response trends in either males or females for the tobacco extract treatment.

a. "Mortality independent" is treated as "incidental" in the tumor analysis. In this column, M = Mortality Independent, I = Incidental, F = Fatal.

b. Number of animals per group = 60; however, the number examined per group may vary (e.g., missing tissue) and be less than 60.

c. The significance levels for the trend tests were adjusted using the Bonferroni approach to control the overall error rate to no more than 0.05 for testing the three trend tests simultaneously. If the dose trends were significant at the Bonferroni adjusted  $0.05/3 = 0.0167$  level, then the p-values were provided in this column.

d. B = benign.

e. F = infiltrative.

f. M = malignant.

a. "Mortality independent" is treated as "incidental" in the tumor analysis. In this column, M = Mortality Independent, I = Incidental, F = Fatal.

b. Number of animals per group = 60; however, the number examined per group may vary (e.g., missing tissue) and be less than 60.

c. The significance levels for the trend tests were adjusted using the Bonferroni approach to control the overall error rate to no more than 0.05 for testing the three trend tests simultaneously. If the dose trends were significant at the Bonferroni adjusted  $0.05/3 = 0.0167$  level, then the p-values were provided in this column.

d. B = benign.

e. F = infiltrative.

f. M = malignant.

a. "Mortality independent" is treated as "incidental" in the tumor analysis. In this column, M = Mortality Independent, I = Incidental, F = Fatal.

b. Number of animals per group = 60; however, the number examined per group may vary (e.g., missing tissue) and be less than 60.

c. The significant levels for the trend tests were adjusted using the Bonferroni approach to controlling the overall error rate to no more than 0.05 for testing the three trend tests simultaneously. If the dose trends were significant at the Bonferroni adjusted  $0.05/3 = 0.0167$  level, then the p-values were provided in this column.

d. B = benign.

e. F = infiltrative.

f. M = malignant.

a. "Mortality independent" is treated as "incidental" in the tumor analysis. In this column, M = Mortality Independent, I = Incidental, F = Fatal.

b. Number of animals per group = 60; however, the number examined per group may vary (e.g., missing tissue) and be less than 60.

c. If the p-values for the dose trends were less than or equal to 0.05, then the p-values were provided in this column.

d. B = benign.

e. F = infiltrative.

f. M = malignant.

a. Tissue codes are defined in Table B-3.

b. Diagnosis codes are defined in Table B-4.

c. Blank cells indicated a lack of variability among the groups involved in the trend tests; statistical analysis cannot be performed if the cell entries are same. These cells can be regarded as having a p-value of 1.

a. Tissue codes are defined in Table B-3.

b. Diagnosis codes are defined in Table B-4.

c. Blank cells indicated a lack of variability among the groups involved in the trend tests; statistical analysis cannot be performed if the cell entries are same. These cells can be treated as having a p-value of 1.
